VHF OMNIRANGE (TVOR) PROCEDURES

When a TVOR instrument approach is conducted at the below named airport(s), it shall be in accordance with the following instrument approach procedure(s), unless an approach is conducted in accordance with a different procedure authorized by the Administrator for such airport(s). Initial approaches shall be made over specified routes. Minimum altitude(s) shall correspond with those established for en route operation in the particular area or as set forth below:

ALWAYS CHECK NOTICES TO AIRMEN SECTION

AIR NAVIGATION RADIO AIDS

INSACS = Interstate Airway Communications Station/s (CAA)

VHF OMNI-RANGE: "Non-commissioned" VHF omni-ranges may lack certain items, such as monitoring or control equipment or may not have been flight-checked and are subject to shut-down at any time without notice. The courses may or may not be within the prescribed tolerances and the station is to be used accordingly.

VAR AND VOR MONITORING CLASSIFICATION FOR AIR TRAFFIC CONTROL PURPOSES: Category I (VAR) = Following conditions must be met: (A) The visual course alignment and signal level are monitored continuously. (B) The aural "A" or "N" sector signal is monitored continuously by the communicator at the associated INSACS. (C) The station identification is monitored continuously by the communicator at the associated INSACS. (D) The aural course alignment is monitored at least once each hour by the communicator at the associated INSACS. Category I (VOR) = Course alignment and signal level are monitored continuously. NOTE: Category I indicated by parenthetical (1). Category II (VAR only) = If all except (D) of the conditions of Category I are met. NOTE: Category II indicated by parenthetical (2). Category III = Facility monitored soley through use of automatic visual course and signal level monitor with automatic transfer unit. This category may permit VOR to be inoperative for a limited period before a notice to airmen is issued. Normally, VHF ranges which are not controlled by an INSACS, and located too distant from INSACS to be monitored with a VHF receiver will fall into Category III. NOTE: Category III indicated by parenthetical (3).

NOTE: Letters between range courses are quadrant identifiers, e.g., "90 YN 180", indicates the quadrant between the two courses is a yellow N quadrant. The letter immediately following a range course indicates whether the course is aural or visual, i.e., "Y" or "B", for yellow or blue, indicates visual: "A" or "N" aural. In the case of low frequency ranges, the A or N cited between two courses is the identification to be heard in the quadrant between those two courses.

RADIO CLASS DESIGNATIONS

AC. . . . . Approach Control Tower, CAA (transmits on voice channel of associated ranges and ILS in addition to frequencies listed)
B. . . . . Scheduled Broadcast Station (broadcasts weather at 15 and 45 minutes after the hour; Air Force Broadcasts, generally, 29 minutes)
C. . . . . Control Tower, CAA
CI. . . . . Control Tower, (City, County, Private, etc.)
D. . . . . Distantly controlled
DME. . . . Distance Measuring Equipment
FM. . . . . VHF fan marker (100 watts)
GCA. . . . Ground Controlled approach system
H. . . . . Non-directional radio beacon (homing), power 50 watts to less than 2000 watts
HH. . . . . Non-directional radio beacon (homing), power 2000 watts or more
ILS. . . . Instrument Landing System (voice on localizer channel)
J. . . . . L/MF (200-415 kc) voice facility on other than range frequency
LFM. . . . VHF fan marker, low powered (5 watts)
LMM. . . Compass locator station when installed at middle marker site
LOM. . . . Compass locator when installed at outer marker site
LVOR. . . Low power VOR (with standby equipment)
MH. . . . . Non-directional radio beacon (homing) power less than 50 watts
ML. . . . . Range (loop radiators), power less than 50 watts
MM. . . . VHF middle marker
MOR. . . . Low frequency omni-drectional range
MRA. . . . Range (adcock, vertical radiators), power 50 or more, but less than 150 watts
MRL. . . . Range (loop radiators), power 50 or more, but less than 150 watts
OM. . . . . VHF outer marker
P. . . . . Point-to-Point radio
RA. . . . . Range (adcock, vertical radiators), power 150 watts or more
RAPCON Radar Approach Control Center.
RL. . . . . Range (loop radiators), power 150 watts or more
S. . . . . Simultaneous range, homing and voice signals available. Inclusion suffix "W" indicates range and homing signals only
T. . . . . Teletype
TVOR. . . Low power VOR (no standby equipment) located on airport
TX. . . . . Principal teletype
V. . . . . Additional VHF voice feature on other than range frequency
VAR. . . . Visual-aural VHF range
VOR. . . . VHF omni-directional range (omni-range)
W. . . . . Without voice facilities on range frequency
Z. . . . . VHF station location marker at a range station

NOTES

1. Range courses are magnetic in-bearings
2. All CAA MH facilities operate continuously unless cited as follows: (on req)
3. All CAA ranges operate continuously. Those which are not manned continuously are cited in the remarks column with hours of operation in parentheses, e.g., (0600-2400)
4. VHF and LF/LMF ranges listed with the same identifier are controlled by the same INSACS. Due to space limitations the DTV and communication frequencies which are listed with the LF/LMF facility are not repeated with the VOR facility

Pilots are requested to indicate when calling C.A.A. airway communications stations and control towers the frequency on which the reply is expected.

RADAR AVAILABLE ; How and Where

(12-28-54)

PAR = Precision Approach Radar. ASR = Airport Surveillance Radar. GCA = Ground Controlled Approach - Military Equivalent of Combined ASR and PAR Equipment. ARSR = Air Route Surveillance Radar. RAPCON = Radar Approach Control Center.

GROUND CONTROLLED APPROACHES - The only airborne equipment required for ground controlled approaches is a functioning radio transmitter and receiver. There are two types of ground controlled approaches - Precision and Surveillance (PPI).

PRECISION APPROACHES - Aircraft are guided to final approach to the designated instrument runway The final approach flight path on a precisionscope (PAR) is greatly expanded for increased accuracy and furnishes the controller with range, azimuth and altitude information. This permits the controller to accurately guide aircraft to touchdown on the runway.

SURVEILLANCE or PPI APPROACHES - Only the ASR scope is used and aircraft may be directed to any selected runway over approximately the same flight path the pilot would take if flying VFR. This scope furnishes range and azimuth information only. Since no altitude information is available to the controller, pilots must control their descent based on the glide angle desired, and the distance from the runway as furnished by the controller. Because ASR does not permit the same degree of accuracy as PAR, the weather minimums for this type of approach are at least as high as, and in some instances higher than, the regular circling minimums listed in the Flight Information Manual for the airport.

RADAR ARRIVAL AND DEPARTURE CONTROL - Radar is utilized by certain radar equipped facilities to control the flight paths of arriving or departing IFR aircraft for the purpose of expediting the flow of traffic. Aircraft operating on IFR flight plans will be afforded a minimum of three miles horizontal separation unless standard non-radar vertical, lateral or longitudinal separation exists. This should not be confused with Ground Controlled Approach (GCA) which is an instrument approach aid.

CAA RADAR UNITS - Operate continuously at the locations listed. Available to all pilots, civil and military. Contact associated CAA control tower on any frequency guarded for initial instructions, or in an emergency any CAA facility for information on nearest Radar Control. Weather minimums, associated runways and GCA procedures are listed in the Flight Information Manual.

RAPCON - At certain locations, the surveillance portion of Military RAPCONS is operated by the CAA and service is available to all aircraft. These are listed below as well as in "Air Navigation Radio Aids" section under proper location.

AIR FORCE AND NAVY GCA UNITS - Available to civil pilots in emergency or by prior arrangement with C.O. of respective facility.
Contact under IFR: Pilots desiring GCA assistance during IFR conditions should call the nearest air traffic control facility (radio, airways, or tower, etc.) requesting GCA and further instructions.
Contact under VFR: VFR check-out of training flights should be arranged locally through Base Operations or the Control Tower.
Emergency: When a receiver or transmitter difficulties exist, the tower may relay GCA approach instructions to the pilot, or the GCA operator may transmit, in blind, instructions for aircraft to make 360 degree turns for identification. In either case, instructions will be followed at the pilot's discretion. After being inoperative, GCA units require 20 to 30 minutes for warming up. Pilots should anticipate requirements for GCA in flight planning and request alerting of GCA units as far in advance as possible Civil Minimums at military installations established by the CAA are 400' ceiling and 1 mile visibility except in emergency unless Air Force or Navy facility being used has higher minimums. Navy units are prepared to transmit on HF from 2,000 to 18,000 kc and receive any frequency from 1,500 to 9,050 kc to aid any plane in emergency.

RADAR FLIGHT ADVISORY SERVICE: This service to aircraft encountering severe weather condition may be obtained by requesting radar advisory through an appropriate ground station or direct ARTC communication. ARTC will determine if service can be provided and will request pilot to change to appropriate frequency for direct communication with radar. Radar station will be identified by "THIS IS AIR FORCE RADAR ADVISORY." All suggested vectors to circumnavigate storm areas will be of advisory nature and do not relieve pilot of responsibility for safety of aircraft. If advisory service cannot be furnished for any reason, the procedure word "UNABLE" will be used. This will terminate radar advisory service to the aircraft without further explanation. This service will be available in the following ARTC Flight Advisory Areas: Chicago, St. Louis, Minneapolis, Kansas City, Albuquerque San Antonio, Ft. Worth, Oakland, Denver, Great Falls, Los Angeles and the Knoxville Air Defense Identification Zone.

CAA OPERATED RADAR UNITS

NOTE: Transmitting frequencies below 118 mc. are not guarded. Other transmitting frequencies listed are guarded plus 122.5 mc and 3023.5 kc. Transmit and guard 121.5 mc all locations.

DIRECTORY OF AIRPORTS – LEGEND

CITY AND AIRPORT NAME

(AF) City and Airport Name (with L or P in Type Column) - a civil airport with Air Force operations, reserve training, or other such activity thereon.

NOTE: Similar combinations of above citation of A,N,CG, and NG indicate the same is applicable for Army, Navy, Coast Guard, and National Guard fields, respectively.

(P) City and Airport Name - Civil Airport covered by an agreement between municipality and U.S. Government which permits use by transient military aircraft.

(PC) Same legal status as (P), but closed to all USAF pilots not possessing their own clearance authority in accordance with AFR 60-16.

NOTES:

1. Where lights are owned or maintained by CAA the site number and airway abbreviation are included in the city and airport name column ie: Chadron, 15, CYS-HON.
2. USAF aircraft are permitted to use only those fields prefixed with an AF, A, N, NG, CG, P, PC.
3. When city and airport names are identical, the airport name is omitted to conserve space.
4. When city is part of airport name, a dash will appear between city and airport, such as Venice-State.

TYPE

P - Public Use L - Limited

NOTES

PUBLIC USE - Intended for general use by the public at large, this category consists of:

(1) Operationally active airports (those attended during normal working hours of each day, and provide, as a minimum of service, aircraft fuel for sale at the airport).
(2) All airports serving scheduled and large irregular air carriers as regular, alternate and provisional stops.
(3) All CAA intermediate landing fields.
(4) All airports having a true light certificate to indicate a lighted airport.

Data on these airports are obtained from physical inspections made by CAA personnel.

LIMITED - All airports not qualifying as "Public Use" (See definition above)

LOCATION

The word "miles" has been eliminated because of space limitations. Mileage is from the center of referenced city to airport and carried in statute miles.

ALWAYS CHECK NOTICES TO AIRMEN SECTION

LOCATION (Continued)

If orientation features are less than 1/2 mile from the field, distance is not specified.

ELEVATION

Elevation is given in feet above mean sea level and is based on highest usable portion of landing area.

NUMBER OF RUNWAYS

No differentiation is made between runways and strips as far as number of landing areas in field is concerned.

LONGEST RUNWAY AND FACILITIES

In this column are included the length and surfacing of the longest runway, the lighting and servicing facilities, weather reports, and unicom available.

RUNWAYS

The length of the longest paved runway or non-paved strip is stated in hundreds of feet, using 70 as division point. If the length is not prefixed, the surface is sod, clay, gravel, etc.

h -runway is paved (concrete, asphalt or similar type of paving)
aw -allway field
(26) -runway or strip length not verified by C.A.A.

LIGHTS

B: Rotating Light (Rotating beacon)
(Green and white, split-beam and other types)
Omission of B indicates rotating light is either not available or not operating standard hours (sunset-sunrise)

NOTE: Code lights are not codified, and are carried in Remarks Column.

L: Field Lighting
L - by itself indicates temporary lighting, such as flares, smudge pots, lanterns.
1 - Portable lights (Electrical)
2 - Boundary
3 - Runway floods
4 - Runway or Strip
5 - Instrument approach (neon)
6 - High intensity runway
7 - High intensity instrument approach

✱ An asterisk preceding an element indicates that it operates on prior request only (by phone call, telegram or letter). Where the asterisk is not shown, the lights are in operation or available sunset to sunrise by request (circling the field or radio call).

Because the obstructions on virtually all lighted fields are obstruction lighted, obstruction lights have not been included in the codification.

SERVICING

S1: Storage
S2: Storage, minor aircraft repairs
S3: Storage, minor aircraft, and minor engine repairs
S4: Storage, major aircraft, and minor engine repairs
S5: Storage, major aircraft, and major engine repairs

NOTE: Any S combination without parenthesis indicates only full-time day attendant. Fields having lighting facilities may have 24 hours attendant available.
Any S combination in parenthesis-part time or irregular attendant.

WEATHER

W: Weather reports available from Weather Bureau or CAA communications station on field.

UNICOM

U: Unicom (Aero Advisory Station transmitting and receiving on 122.8 mc). Operates during airport hours only.

FUEL OCTANE

F1: 80 oct., at least
F2: 80/87 oct., and lower
F3: 91/96 oct., and lower
F4: 100/130 oct., and lower

NOTE: If only one octane available, this octane cited, and not coded.
Any F combination without parenthesis indicates full time day attendant, in parenthesis part-time or irregular attendant.

REMARKS

(a) "INACTIVE" indicates usable civil field, but not being operated, at last inspection. Caution advised.
(b) "CLOSED" indicates closed to all traffic except in emergency.
(c) "ABANDONED" indicates reverted to non-airport usage such as farming or grazing.
(d) "REPORTED ABANDONED" indicates an airport reported abandoned but not verified as such by C.A.A.
(e) "FEE" indicates landing charges for private or non-revenue producing aircraft. In addition, fees may be charged for planes that remain over a couple of hours and buy no services, or at major airline terminals for all aircraft.
(f) "Blkd" indicates approaches where glide angle to runway is 3:1 or less.
(g) "Rgt tfc N" indicates right turns should be made on landings and take-offs to N.

NOTES

1. ← New or revised data.
2. SCHEDULED AIRLINE STOP: Airport names are capitalized.
3. OBSTRUCTIONS: Because of space limitations only the more dangerous obstructions are indicated. Natural obstructions, like trees, for example, clearly discernible for contact operations, are frequently omitted. On the other hand, all pole lines within at least 15:1 glide angle are indicated.
4. NEW AIRPORTS: At the end of each state, under this listing will be found, out of alphabetical alignment, all the new airports tabulated after the type for that state had been originally set up.

NOTICES TO AIRMEN

SPECIAL NOTICES

√ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so-called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the Office of Aviation Information, Attention: W-52, CAA, Washington 25, D.C.)

Permanent airport data changes (as differentiated from temporary hazardous conditions) should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide.

CIVIL USAGE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission of the commanding officers thereof.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft, 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shutdown, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical location. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert of these apparent vagaries.

DVER FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations and outer compass locators).

Omniranges and outer compass locators where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification: e. g. Long Beach omni (voice) .-.. --. -... (LGB in Code).

For omniranges, as in the example given above, the normal voice identification consists of the name of the omni followed by the word "omni". However, if the omnirange is unattended, that is, if no facility for providing air-ground communications services is associated with the omnirange, the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

NEW AIR TRAFFIC CLEARANCE PHRASEOLOGY ADOPTED: The phrase "VIA FLIGHT PLANNED ROUTE" has been adopted for use in air traffic clearances and may be used to replace the detailed description of any portion of the route of flight that is identical to the route filed by the pilot. IFR flight plans filed by pilots must contain the complete route of flight and must be relayed to air traffic control unchanged in order for this phraseology to be successfully used.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

NAUTICAL MILE AND STATUTE MILE ABBREVIATIONS: The following abbreviations have been adopted for use in the Airmen's Guide: "n miles" or "n mi" for nautical miles; "s miles" or "s mi" for statute miles.

PRIVATE AIRCRAFT-TO-TOWER FREQUENCIES: Due to severe congestion on the frequency 122.5 mc in the New York City, Chicago and Los Angeles areas, it has become necessary to implement the frequency 122.7 mc at the New York (LaGuardia), Chicago (Midway), and the Los Angeles (International) Airport towers. Effective 0001 Local Standard Time, December 1, 1954, a guard on the frequency 122.7 mc will be established and simultaneously the guard on 122.5 mc will be discontinued at these three towers. Pilots of private aircraft intending to land at New York (LaGuardia), Chicago (Midway) or Los Angeles (International) Airports should be equipped to transmit on 122.7 mc. The emergency frequency 121.5 mc may be used temporarily to call these towers in the event it is not possible to obtain 122.7 mc by December 1.

"DANGER AREAS" TO BE CALLED "RESTRICTED AREAS": Effective December 9, 1954, Part 60 of the Civil Air Regulations is amended to provide, among other things, for the use of the term "Restricted Area" for what was formerly called "Danger Area" and for a definition of this term as well as that of "Prohibited Area" (somewhat similar to the former term "Airspace Reservation.").

Restricted Areas (which are designated by the Administrator of Civil Aeronautics when he finds that a hazard to aircraft in flight exists) are defined as "airspace identified by an area on the surface of the earth within which the flight of aircraft, while not wholly prohibited, is subject to restrictions".

Prohibited Areas are defined as "airspace identified by an area on the surface of the earth within which the flight of aircraft is prohibited."

Avoidance of prohibited areas and operations within restricted areas strictly in accordance with the published restrictions are imperative to the safety of flight or the protection of the activity on the ground. Any person desiring to secure permission to fly in such areas contrary to the prohibition or the restrictions imposed, should contact the agency controlling that area. Prohibited and restricted areas, indicating the prohibitions or restrictions to flight and the name of the using agency, are carried in the Airman's Guide, appear in other publications of aids to air navigations and are depicted on aeronautical charts.

(12-28-54)

SPEED IN HOLDING PATTERNS: All patterns used for holding are based on a maximum speed of 180 mph true air speed. Entry into and maneuvering within these patterns should be made at speeds within this tolerance as buffer zones have been provided only for these speeds. It is recommended that all aircraft adhere closely to these restrictions and if greater speed is needed, traffic control be notified so that more maneuvering area may be provided.

√RESTRICTED AREA AMENDMENT: The following restricted area shall be effective January 4, 1955 thru April 3, 1955.

In Section 608.15, a Camp Hale, Colorado temporary area, (R-482) is added to read: Name: Camp Hale, Colorado; Description: North boundary: latitude 39°40'00", East boundary: longitude 106°03'00"; South boundary: latitude 39°21'00"; West boundary: longitude 106°26' 00". Designated Altitudes: Surface to 20,000 feet MSL. Time of Designation: Unlimited January 4, 1955 to April 3, 1955. Using Agency: Camp Carson, Colorado.

√AIRMAN'S GUIDE CORRECTIONS: Correct Airman's Guide, Volume 9, No. 18 dated November 16, 1954 as follows:

(1) Page 4- Item 22- Whitwell (VOR) Intsxn - Chattanooga 312° magnetic radial should read: Chattanooga 311° magnetic radial.

(2) Page 4 - Item 4 - Reid Intersection - direction northwest on the northeast course of Greensboro should read: "direction northeast on the northeast course."

Item 5 - Reid Intersection (VHF) - "...northeast on the 055° magnetic radial. Inbound course to fix 235° magnetic...should read: "northeast on the 054° magnetic radial.

Item 15-Charlotte, N.C. ILS outer compass locator...."...direction from holding point-SW on the SE crs of ILS localizer.....should read: "direction from holding point - SW on the SW course of the localizer."

√AIR ROUTE TRAFFIC CONTROL BOUNDARY AMENDMENT: Effective immediately the following ARTC boundary is established as follows:

(1) The Washington-Pittsburgh ARTC boundary is established to read: At uniform points 35 statute miles northwest or west of the Martinsburg, West Virginia, VOR station on Victor 8, Victor 44, Red 20, Red 61, Blue 47, and on the new Johnstown, Pennsylvania - Martinsburg Victor airway.

√ON-REQUEST REPORTING POINTS: Effective immediately the following on-request reporting points are designated or cancelled as indicated:

DESIGNATED

(1) EMPIRE INTSXN - Wheeling, West Va., VOR 360° magnetic radial to intersect the Greater Pittsburgh ILS west course and/or a bearing from the Clinton "MH" facility to this point.

(2) WHEATLAND INTSXN - intersection of the east course of the Williams, Calif., LFR and a 160° magnetic bearing to the McClellan, Calif., Rbn.

VOR RECEIVER CHECK SIGNALS

Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods: (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator (FPDI) centered the omnibearing selector should read 0° with the to-from indication being "From" or the omnibearing selector should read 180° with the to-from indication read "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°. (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an individual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that should be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of ± 4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of Dec. 27, 1954,. check points or facilitites have been established at the following airports (listed under city name).

(NOTE: ALL DISTANCES ARE IN STATUTE MILES.)

NOTICE: Instrument approach procedures are no longer published in the Flight Information Manual. The Airman's Guide currently publishes new and amended instrument approach procedures with the lowest landing and take-off minimums possible under the obstruction clearance requirements of the Regulations of the Administrator, Part 609. These procedures are applicable to all users. The IFR take-off or landing minimums shall not apply to military aircraft of the United States Armed Forces. The IFR landing minimums are applicable to all users except the military as noted above. The IFR take-off minimums are applicable to all users while conducting operations under the authority of Parts 40, 41, 42, 44, or 45 of the Civil Air Regulations, but are not presently applicable to users conducting operations under Part 43 of the Civil Air Regulations. ILS and GCA (PAR) straight-in landing minimums, formerly published no lower than 400-3/4, may in some instances be lowered to 200-1/2. Straight-in LFR, ADF and VOR landing minimums, formerly no lower than 500-1, may in some instances be lowered to 400-1. There are now three categories of aircraft minimums, namely those for (1) 75 mph or less - 2-engine or less, (2) more than 75 mph - 2-engine or less, and (3) more than 75 mph - more than 2-engine. All users are warned that the lowering of these minimums published in the Airman's Guide does not necessarily imply that obstructions have been lowered or removed.

VHF OMNIRANGE (TVOR) PROCEDURES

NOTICES TO AIRMEN
SPECIAL NOTICES

√ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so-called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the Office of Aviation Information, Attention: W-52, CAA, Washington 25, D.C.)

Permanent airport data changes (as differentiated from temporary hazardous conditions) should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide.

CIVIL USAGE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission of the commanding officers thereof.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft, 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shutdown, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical location. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course-deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert of these apparent vagaries.

DVOR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations and outer compass locators). N

Omniranges and outer compass locators where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification: e. g. Long Beach omni (voice) .-.. --. -... (LGB in Code).

For omniranges, as in the example given above, the normal voice identification consists of the name of the omni followed by the word "omni". However, if the omnirange is unattended, that is, if no facility for providing air-ground communications services is associated with the omnirange, the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

NEW AIR TRAFFIC CLEARANCE PHRASEOLOGY ADOPTED: The phrase "VIA FLIGHT PLANNED ROUTE" has been adopted for use in air traffic clearances and may be used to replace the detailed description of any portion of the route of flight that is identical to the route filed by the pilot. IFR flight plans filed by pilots must contain the complete route of flight and must be relayed to air traffic control unchanged in order for this phraseology to be successfully used.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

NAUTICAL MILE AND STATUTE MILE ABBREVIATIONS: The following abbreviations have been adopted for use in the Airmen's Guide: "n miles" or "n mi" for nautical miles; "s miles" or "s mi" for statute miles.

PRIVATE AIRCRAFT-TO-TOWER FREQUENCIES: Due to severe congestion on the frequency 122.5 mc in the New York City, Chicago and Los Angeles areas, it has become necessary to implement the frequency 122.7 mc at the New York (LaGuardia), Chicago (Midway), and the Los Angeles (International) Airport towers. Effective 0001 Local Standard Time, December 1, 1954, a guard on the frequency 122.7 mc will be established and simultaneously the guard on 122.5 mc will be discontinued at these three towers. Pilots of private aircraft intending to land at New York (LaGuardia), Chicago (Midway) or Los Angeles (International) Airports should be equipped to transmit on 122.7 mc. The emergency frequency 121.5 mc may be used temporarily to call these towers in the event it is not possible to obtain 122.7 mc by December 1.

"DANGER AREAS" TO BE CALLED "RESTRICTED AREAS": Effective December 9, 1954, Part 60 of the Civil Air Regulations is amended to provide, among other things, for the use of the term "Restricted Area" for what was formerly called "Danger Area" and for a definition of this term as well as that of "Prohibited Area" (somewhat similar to the former term "Airspace Reservation.").

Restricted Areas (which are designated by the Administrator of Civil Aeronautics when he finds that a hazard to aircraft in flight exists) are defined as "airspace identified by an area on the surface of the earth within which the flight of aircraft, while not wholly prohibited, is subject to restrictions".

Prohibited Areas are defined as "airspace identified by an area on the surface of the earth within which the flight of aircraft is prohibited."

Avoidance of prohibited areas and operations within restricted areas strictly in accordance with the published restrictions are imperative to the safety of flight or the protection of the activity on the ground. Any person desiring to secure permission to fly in such areas contrary to the prohibition or the restrictions imposed, should contact the agency controlling that area. Prohibited and restricted areas, indicating the prohibitions or restrictions to flight and the name of the using agency, are carried in the Airman's Guide, appear in other publications of aids to air navigations and are depicted on aeronautical charts.

The printing of this publication has been approved by the Director of the Bureau of the Budget, April 8, 1953

(1-11-55)

SPEED IN HOLDING PATTERNS: All patterns used for holding are based on a maximum speed of 180 mph true air speed. Entry into and maneuvering within these pattern should be made at speed within this tolerance as buffer zones have been provided only for these speeds. It is recommended that all aircraft adhere closely to these restrictions and if greater speed is needed, traffic control be notified so that more maneuvering area may be provided.

VOR RECEIVER CHECK SIGNALS

Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods: (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator (FPDI) centered the omnibearing selector should read 0° with the to-from indication being "From" or the omnibearing selector should read 180° with the to-from indication read "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°. (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an individual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that should be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of ± 4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of Jan. 11, 1955, check points or facilitites have been established at the following airports (listed under city name).

Revisions to Instrument Approach Procedures

(NOTE: ALL DISTANCES ARE IN STATUTE MILES.)

NOTICE: **Instrument approach procedures are no longer published in the Flight Information Manual. The Airman's Guide currently publishes new and amended instrument approach procedures with the lowest landing and take-off minimums possible under the obstruction clearance requirements of the Regulations of the Administrator, Part 609. These procedures are applicable to all users. The IFR take-off or landing minimums shall not apply to military aircraft of the United States Armed Forces. The IFR landing minimums are applicable to all users except the military as noted above. The IFR take-off minimums are applicable to all users while conducting operations under the authority of Parts 40, 41, 42, 44, or 45 of the Civil Air Regulations, but are not presently applicable to users conducting operations under Part 43 of the Civil Air Regulations. ILS and GCA (PAR) straight-in landing minimums, formerly published no lower than 400-3/4, may in some instances be lowered to 200-1/2. Straight-in LFR, ADF and VOR landing minimums, formerly no lower than 500-1, may in some instances be lowered to 400-1. There are now three categories of aircraft minimums, namely those for (1) 75 mph or less - 2-engine or less, (2) more than 75 mph - 2-engine or less, and (3) more than 75 mph - more than 2-engine. All users are warned that the lowering of these minimums published in the Airman's Guide does not necessarily imply that obstructions have been lowered or removed.**

LOW FREQUENCY RANGE PROCEDURES

When an LFR instrument approach is conducted at the below named airport(s), it shall be in accordance with the following instrument approach procedure(s), unless an approach is conducted in accordance with a different procedure authorized by the Administrator for such airport(s). Initial approaches shall be made over specified routes. Minimum altitude(s) shall correspond with those established for en route operation in the particular area or as set forth below:

ALWAYS CHECK NOTICES TO AIRMEN SECTION

AIR NAVIGATION RADIO AIDS

INSACS = Interstate Airway Communications Station/s (CAA)

VHF OMNI-RANGE: "Non-commissioned" VHF omni-ranges may lack certain items, such as monitoring or control equipment or may not have been flight-checked and are subject to shut-down at any time without notice. The courses may or may not be within the prescribed tolerances and the station is to be used accordingly.

VAR AND VOR MONITORING CLASSIFICATION FOR AIR TRAFFIC CONTROL PURPOSES: Category I (VAR) = Following conditions must be met: (A) The visual course alignment and signal level are monitored continuously. (B) The aural "A" or "N" sector signal is monitored continuously by the communicator at the associated INSACS. (C) The station identification is monitored continuously by the communicator at the associated INSACS. (D) The aural course alignment is monitored at least once each hour by the communicator at the associated INSACS. Category I (VOR) = Course alignment and signal level are monitored continuously. NOTE: Category I indicated by parenthetical (1). Category II (VAR only) = If all except (D) of the conditions of Category I are met. NOTE: Category II indicated by parenthetical (2). Category III = Facility monitored soley through use of automatic visual course and signal level monitor with automatic transfer unit. This category may permit VOR to be inoperative for a limited period before a notice to airmen is issued. Normally, VHF ranges which are not controlled by an INSACS, and located too distant from INSACS to be monitored with a VHF receiver will fall into Category III. NOTE: Category III indicated by parenthetical (3).

NOTE: Letters between range courses are quadrant identifiers, e.g., "90 YN 180", indicates the quadrant between the two courses is a yellow N quadrant. The letter immediately following a range course indicates whether the course is aural or visual, i.e., "Y" or "B", for yellow or blue, indicates visual: "A" or "N" aural. In the case of low frequency ranges, the A or N cited between two courses is the identification to be heard in the quadrant between those two courses.

RADIO CLASS DESIGNATIONS

AC. . . . . Approach Control Tower, CAA (transmits on voice channel of associated ranges and ILS in addition to frequencies listed)
B. . . . . Scheduled Broadcast Station (broadcasts weather at 15 and 45 minutes after the hour; Air Force Broadcasts, generally, 29 minutes)
C. . . . . Control Tower, CAA
CI. . . . . Control Tower, (City, County, Private, etc.)
D. . . . . Distantly controlled
DME. . . . Distance Measuring Equipment
FM. . . . . VHF fan marker (100 watts)
GCA. . . . Ground Controlled approach systen.
H. . . . . Non-directional radio beacon (homing), power 50 watts to less than 2000 watts
HH. . . . . Non-directional radio beacon (homing), power 2000 watts or more
ILS. . . . Instrument Landing System (voice on localizer channel)
J. . . . . L/MF (200-415 kc) voice facility on other than range frequency
LFM. . . . VHF fan marker, low powered (5 watts)
LMM. . . Compass locator station when installed at middle marker site
LOM. . . . Compass locator when installed at outer marker site
LVOR. . . Low power VOR (with standby equipment)
MH. . . . . Non-directional radio beacon (homing) power less than 50 watts
ML. . . . . Range (loop radiators), power less than 50 watts
MM. . . . VHF middle marker
MOR. . . . Low frequency omni-drectional range
MRA. . . . Range (adcock, vertical radiators), power 50 or more, but less than 150 watts
MRL. . . . Range (loop radiators), power 50 or more, but less than 150 watts
OM. . . . . VHF outer marker
P. . . . . Point-to-Point radio
RA. . . . . Range (adcock, vertical radiators), power 150 watts or more
RAPCON Radar Approach Control Center.
RL. . . . . Range (loop radiators), power 150 watts or more
S. . . . . Simultaneous range, homing and voice signals available. Inclusion suffix "W" indicates range and homing signals only
T. . . . . Teletype
TVOR. . . Low power VOR (no standby equipment) located on airport
TX. . . . . Principal teletype
V. . . . . Additional VHF voice feature on other than range frequency
VAR. . . . Visual-aural VHF range
VOR. . . . VHF omni-directional range (omni-range)
W. . . . . Without voice facilities on range frequency
Z. . . . . VHF station location marker at a range station

NOTES

1. Range courses are magnetic in-bearings
2. All CAA MH faciiities operate continuously unless cited as follows: (on req)
3. All CAA ranges operate continuously. Those which are not manned continuously are cited in the remarks column with hours of operation in parentheses, e.g., (0600-2400)
4. VHF and LF/LMF ranges listed with the same identifier are controlled by the same INSACS. Due to space limitations the DTV and communication frequencies which are listed with the LF/LMF facility are not repeated with the VOR facility

Pilots are requested to indicate when calling C.A.A. airway communications stations and control towers the frequency on which the reply is expected.

RADAR AVAILABLE : How and Where

(1-29-55)

PAR = Precision Approach Radar. ASR = Airport Surveillance Radar. GCA = Ground Controlled Approach - Military Equivalent of Combined ASR and PAR Equipment. ARSR = Air Route Surveillance Radar. RAPCON = Radar Approach Control Center.

GROUND CONTROLLED APPROACHES - The only airborne equipment required for ground controlled approaches is a functioning radio transmitter and receiver. There are two types of ground controlled approaches - Precision and Surveillance (PPI).

PRECISION APPROACHES - Aircraft are guided to final approach to the designated instrument runway The final approach flight path on a precisionscope (PAR) is greatly expanded for increased accuracy and furnishes the controller with range, azimuth and altitude information. This permits the controller to accurately guide aircraft to touchdown on the runway.

SURVEILLANCE or PPI APPROACHES - Only the ASR scope is used and aircraft may be directed to any selected runway over approximately the same flight path the pilot would take if flying VFR. This scope furnishes range and azimuth information only. Since no altitude information is available to the controller, pilots must control their descent based on the glide angle desired, and the distance from the runway as furnished by the controller. Because ASR does not permit the same degree of accuracy as PAR, the weather minimums for this type of approach are at least as high as, and in some instances higher than, the regular circling minimums listed in the Flight Information Manual for the airport.

RADAR ARRIVAL AND DEPARTURE CONTROL - Radar is utilized by certain radar equipped facilities to control the flight paths of arriving or departing IFR aircraft for the purpose of expediting the flow of traffic. Aircraft operating on IFR flight plans will be afforded a minimum of three miles horizontal separation unless standard non-radar vertical, lateral or longitudinal separation exists. This should not be confused with Ground Controlled Approach (GCA) which is an instrument approach aid.

CAA RADAR UNITS - Operate continuously at the locations listed. Available to all pilots, civil and military. Contact associated CAA control tower on any frequency guarded for initial instructions, or in an emergency any CAA facility for information on nearest Radar Control. Weather minimums, associated runways and GCA procedures are listed in the Flight Information Manual.

RAPCON - At certain locations, the surveillance portion of Military RAPCONS is operated by the CAA and service is available to all aircraft. These are listed below as well as in "Air Navigation Radio Aids" section under proper location.

AIR FORCE AND NAVY GCA UNITS - Available to civil pilots in emergency or by prior arrangement with C.O. of respective facility.
Contact under IFR: Pilots desiring GCA assistance during IFR conditions should call the nearest air traffic control facility (radio, airways, or tower, etc.) requesting GCA and further instructions.
Contact under VFR: VFR check-out of training flights should be arranged locally through Base Operations or the Control Tower.
Emergency: When a receiver or transmitter difficulties exist, the tower may relay GCA approach instructions to the pilot, or the GCA operator may transmit, in blind, instructions for aircraft to make 360 degree turns for identification. In either case, instructions will be followed at the pilot's discretion.
After being inoperative, GCA units require 20 to 30 minutes for warming up. Pilots should anticipate requirements for GCA in flight planning and request alerting of GCA units as far in advance as possible
Civil Minimums at military installations established by the CAA are 400' ceiling and 1 mile visibility except in emergency unless Air Force or Navy facility being used has higher minimums. Navy units are prepared to transmit on HF from 2,000 to 18,000 kc and receive any frequency from 1,500 to 9,050 kc to aid any plane in emergency.

RADAR FLIGHT ADVISORY SERVICE: This service to aircraft encountering severe weather condition may be obtained by requesting radar advisory through an appropriate ground station or direct ARTC communication. ARTC will determine if service can be provided and will request pilot to change to appropriate frequency for direct communication with radar. Radar station will be identified by "THIS IS AIR FORCE RADAR ADVISORY." All suggested vectors to circumnavigate storm areas will be of advisory nature and do not relieve pilot of responsibility for safety of aircraft. If advisory service cannot be furnished for any reason, the procedure word "UNABLE" will be used. This will terminate radar advisory service to the aircraft without further explanation. This service will be available in the following ARTC Flight Advisory Areas: Chicago, St. Louis, Minneapolis, Kansas City, Albuquerque San Antonio, Ft. Worth, Oakland, Denver, Great Falls, Los Angeles and the Knoxville Air Defense Identification Zone.

CAA OPERATED RADAR UNITS

NOTE: Transmitting frequencies below 118 mc. are not guarded. Other transmitting frequencies listed are guarded plus 122.5 mc and 3023.5 kc. Transmit and guard 121.5 mc all locations.

NOTICES TO AIRMEN
SPECIAL NOTICES

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so-called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the Office of Aviation Information, Attention: W-52, CAA, Washington 25, D.C.)

Permanent airport data changes (as differentiated from temporary hazardous conditions) should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide.

CIVIL USAGE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission of the commanding officers thereof.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft, 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shutdown, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical location. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert of these apparent vagaries.

DVER FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations and outer compass locators).

Omniranges and outer compass locators where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification: e. g. Long Beach omni (voice) .-.. --. -... (LGB in Code).

For omniranges, as in the example given above, the normal voice identification consists of the name of the omni followed by the word "omni". However, if the omnirange is unattended, that is, if no facility for providing air-ground communications services is associated with the omnirange, the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

NEW AIR TRAFFIC CLEARANCE PHRASEOLOGY ADOPTED: The phrase "VIA FLIGHT PLANNED ROUTE" has been adopted for use in air traffic clearances and may be used to replace the detailed description of any portion of the route of flight that is identical to the route filed by the pilot. IFR flight plans filed by pilots must contain the complete route of flight and must be relayed to air traffic control unchanged in order for this phraseology to be successfully used.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

NAUTICAL MILE AND STATUTE MILE ABBREVIATIONS: The following abbreviations have been adopted for use in the Airmen's Guide: "n miles" or "n mi" for nautical miles; "s miles" or "s mi" for statute miles.

✓ LOCATION IDENTIFIERS: The following changes affect the use of location identifiers:

(6) Page 66 - Delete the material concerning Radar Monitoring of Instrument Approaches and substitute the following:

At CAA radar locations, all instrument approaches on the ILS or other letdown facilitites which are made within the coverage of the precision radar equipment (PAR) will be observed whenever the weather is below the basic VFR minimums (1000 and 3). Radar advisory information will be furnished to a pilot:

a. Automatically when an approach can be observed on PAR and the ceiling and/or visibility is below the highest circling minimum for the airport; or
b. When radar observation reveals a situation or an emergency which, in the opinion of the controller, can affect the safety of the flight.

Prior to starting final approach, the pilot will be advised of the frequency on which the advisories will be transmitted. This will normally be the ILS localizer voice channel. If radar advisories cannot be furnished for any reason, the pilot will be so advised.

Radar advisories will be terminated when the pilot reports contact or that he has the runway in sight.

✓ ON-REQUEST REPORTING POINTS: Effective immediately the following on-request reporting point has been established.

(1) KEENE INTERSECTION - intersection Gardner, Massachusetts, VOR direct radial to Keene, New Hampshire, "MH" facility with Concord VOR en route radial on Victor 93.

✓ NON-STANDARD HOLDING PATTERNS: Effective immediately the following non-standard holding patterns are established.

(2) TOPEKA, KANSAS, (LFR) - Direction of holding - NE; direction of turn - LEFT; time - one minute; minimum altitude - 3000'.

The following non-standard holding pattern is amended to read:

(3) KANSAS CITY L/MF RADIO RANGE - direction of holding - NW; direction of turn - LEFT; time - one minute; minimum altitude - 2400'

✓ AIR ROUTE TRAFFIC CONTROL BOUNDARY AND FLIGHT ADVISORY AREA BOUNDARY AMENDMENTS: Effective immediately the following ARTC and Flight Advisory area boundary is established as follows:

(1) CLEVELAND-NEW YORK ARTC and FLIGHT ADVISORY AREA BOUNDARY is established on Victor 170 by extending the present boundary line from the eastern edge of Victor 33 (25 statute miles northwest of Philipsburg VOR) in an easterly direction to the intersection point of the northeast edge of Victor 170 with the northwest edge of Victor 35 (approximately 10 statute miles northeast of the Lock Haven Intersection).

✓ AERONAUTICAL CHART CORRECTIONS: Correct the following aeronautical charts as indicated:

(1) Miles City Sectional Chart dated October 13, 1954 - Add control area extension 5 statute miles on both sides of NW course of Miles City radio range to a point 30 statute miles from the radio range station.

(2) WAC No. 267 dated November 5, 1954 - Add Control area extension 5 statute miles on both sides of NW course of Miles City radio range to a point 30 statute miles from the radio range station.

(3) RF Chart RF1 7th Edition dated December 21, 1954 - correct the minimum en route altitude eastbound on VOR civil airway No. V-2 between Spokane, Washington and Rockford fan marker from 5,000 feet to 9,000 feet.

Revisions to Instrument Approach Procedures

(NOTE: ALL DISTANCES ARE IN STATUTE MILES.)

NOTICE: Instrument approach procedures are no longer published in the Flight Information Manual. The Airman's Guide currently publishes new and amended instrument approach procedures with the lowest landing and take-off minimums possible under the obstruction clearance requirements of the Regulations of the Administrator, Part 609. These procedures are applicable to all users. The IFR take-off or landing minimums shall not apply to military aircraft of the United States Armed Forces. The IFR landing minimums are applicable to all users except the military as noted above. The IFR take-off minimums are applicable to all users while conducting operations under the authority of Parts 40, 41, 42, 44, or 45 of the Civil Air Regulations, but are not presently applicable to users conducting operations under Part 43 of the Civil Air Regulations. ILS and GCA (PAR) straight-in landing minimums, formerly published no lower than 400-3/4, may in some instances be lowered to 200-1/2. Straight-in LFR, ADF and VOR landing minimums, formerly no lower than 500-1, may in some instances be lowered to 400-1. There are now three categories of aircraft minimums, namely those for (1) 75 mph or less - 2-engine or less, (2) more than 75 mph - 2-engine or less, and (3) more than 75 mph - more than 2-engine. All users are warned that the lowering of these minimums published in the Airman's Guide does not necessarily imply that obstructions have been lowered or removed.

INSTRUMENT LANDING SYSTEM PROCEDURES

When an ILS instrument approach is conducted at the below named airport(s), it shall be in accordance with the following instrument approach procedure(s), unless an approach is conducted in accordance with a different procedure authorized by the Administrator for such airport(s). Initial approaches shall be made over specified routes. Minimum altitude(s) shall correspond with those established for en route operation in the particular area or as set forth below:

NOTICES TO AIRMEN Page 2

VOL. 9, NO. 24. . . .FEBRUARY 8, 1955

The AIRMAN'S GUIDE is issued every two weeks. This issue includes all data on record as of 0001 E.S.T. on the above date. For later information consult Teletype NOTAMS.

OFFICE OF AVIATION INFORMATION

NOTICES TO AIRMEN

SPECIAL NOTICES

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so-called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the Office of Aviation Information, Attention: W-52, CAA, Washington 25, D.C.)

Permanent airport data changes (as differentiated from temporary hazardous conditions) should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide.

CIVIL USAGE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission of the commanding officers thereof.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft, 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shutdown, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical location. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert of these apparent vagaries.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations and outer compass locators).

Omniranges and outer compass locators where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification: e. g. Long Beach omni (voice) .-.. --. -... (LGB in Code).

For omniranges, as in the example given above, the normal voice identification consists of the name of the omni followed by the word "omni". However, if the omnirange is unattended, that is, if no facility for providing air-ground communications services is associated with the omnirange, the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

NEW AIR TRAFFIC CLEARANCE PHRASEOLOGY ADOPTED: The phrase "VIA FLIGHT PLANNED ROUTE" has been adopted for use in air traffic clearances and may be used to replace the detailed description of any portion of the route of flight that is identical to the route filed by the pilot. IFR flight plans filed by pilots must contain the complete route of flight and must be relayed to air traffic control unchanged in order for this phraseology to be successfully used.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

NAUTICAL MILE AND STATUTE MILE ABBREVIATIONS: The following abbreviations have been adopted for use in the Airmen's Guide: "n miles" or "n mi" for nautical miles; "s miles" or "s mi" for statute miles.

✓ LOCATION IDENTIFIERS: The following changes affect the use of location identifiers:

FCN	Fort Carson, Colo., AAF (Assignment)

✓ CIVIL AIRWAYS, CONTROL AREA EXTENSIONS, CONTROL ZONE AND REPORTING POINT AMENDMENTS: Effective March 1, 1955, unless otherwise advised the following civil airways, control area extensions, control zones and reporting points are amended in whole or in part as follows:

CIVIL AIRWAYS: (1) Red Civil Airway No. 12 is amended by changing caption to read: "(Joliet, Illinois, to Williamsport, Pa.) and by changing the portion before the South Bend, Ind., radio range station to read: "From the Joliet, Ill., radio range station via the intersection of the east course of the Joliet, Ill., radio range and the west course of the South Bend, Ind., radio range; South Bend, Ind., radio range station." (Note: Above deletes the portion between Bradford, Ill., and Joliet, Ill.)

(2) Blue Civil Airway No. 6 (Abilene, Tex., to Muskegon, Mich.) is amended by changing the portion which reads: "From the Springfield, Ill., radio range station via the Peoria, Ill., radio range station to the intersection of the north course of the Peoria, Ill., radio range and the southwest course of the Joliet, Ill., radio range." to read: "From the Springfield, Ill., radio range station to the Peoria, Ill., radio range station. " (Note: Above deletes the portion between Peoria, Ill., and Bradford, Ill.).

CONTROL AREAS: (1) Red Civil Airway No. 12 is amended by changing the caption to read: (Joliet, Ill., to Williamsport, Pa.)

CONTROL AREA EXTENSIONS: (1)(Moses Lake, Wash.) is amended to read: "That airspace south of Green civil airway No. 2 within a 30 statute mile radius of the Larson Air Force Base, Moses Lake, Wash., excluding the portion which overlaps the Hanford, Wash., Airspace Reservation." (Note: Above is a correction for the Federal Register based on recission of Moses Lake danger area, which no longer applies to this extension).

(2) (Bangor, Maine) is amended to read: "That airspace within a 25 statute mile radius of Dow AirForce Base, Bangor, Maine."

(3) (Limestone, Maine) is added to read: "That airspace over United States territory within a 40 statute mile radius of Loring Air Force Base, Limestone, Maine, excluding the portion which overlaps Restricted Area (R-80)."

CONTROL ZONES: (1) (Bangor, Maine) is amended to read: "Within a 5 statute mile radius of Dow AirForce Base, Bangor, Maine, within 2 statute miles either side of the northwest course of the Bangor radio range extending from the radio range station to the East Corinth fan marker, within 2 statute miles either side of a line bearing 314° true extending from Dow Air Force Base to a point 15 statute miles northwest of the Air Force Base, and within 2 statute miles either side of a line bearing 356° true extending from the Air Force Base to a point 10 statute miles north of the Bangor omnirange station."

(2) (Limestone, Maine) is amended to read: "That airspace over United States territory within a 6 statute miles radius of Loring Air Force Base, Limestone, Maine, within 2 statute miles either side of a direct line extending between the Loring AFB and the Loring AFB omnirange station, and within 2 statute miles either side of a direct line extending between the Loring AFB non directional radio beacon and the Presque Isle, Maine radio range station excluding the portion which overlaps the Presque Isle control zone.".

(3) (Five mile radius zones) is amended by deleting the following airports: Old Town, Maine - Old Town Airport; Gordonsville, Va. - CAA Intermediate Field.

(4) (Jack's Creek, Tenn.) control zone is revoked.

REPORTING POINT: (1) Red Civil Airway No. 12 is amended by changing caption to read: (Joliet, Ill., to Williamsport, Pa.).

✓ AIR ROUTE TRAFFIC CONTROL BOUNDARY: Effective immediately the following ARTC boundary is established:

(1) WASHINGTON-JACKSONVILLE ARTC BNDRY is established on Amber 7 Victor 3 and Victor 3 W at points 20 s miles NE and N of Florence, S.C. VOR station.

✓ NON-STANDARD HOLDING PATTERNS: Effective immediately the following non-standard holding patterns are established:

(1) SMOKY HILL HOMER - direction of holding - N; direction of turn -RIGHT inbound heading 170°; time - 1 minute.

(2) WILMINGTON, N.C. "MH" - direction of holding - NW on the 341° magnetic bearing of the MH facility; inbound course 161° magnetic; direction of turn - RIGHT; time - 1 minute minimum altitude 1400'.

(3) WILMINGTON, N.C. "ILS-LOM" - direction of holding - SE on ILS lclzr crs (163° magnetic outbnd, 343° magnetic inbnd); direction of turn-RIGHT; time-1 minute; minimum altitude 1400'.

(4) WILMINGTON, NC VOR- direction of holding NE on the Wilmington 049°mag radial; inbnd crs to fix 229° mag rad; direction of turn-RIGHT; time- 1 minute; minimum alt. 1300'

✓ ATOMIC ENERGY COMMISION CONDUCTING SERIES OF TESTS: Starting about mid-February 1955, the Atomic Energy Commission will conduct at its Nevada test site a series of atomic tests. The series will conform generally with those previously held in Nevada. Operators of highly sensitive airborne prospecting equipment should take special precautions and should communicate with U. S. Atomic Energy Commission, Division of Raw Materials offices in Denver and Grand Junction, Colorado or in Salt Lake City, Utah for specific information on location of areas of increased radioactivity after each test is announced in the local press.

✓ BALLOON RELEASE AND LEAFLET DROPS FEBRUARY 12 AND 22: All pilots are advised that at noon local time on February 12, 1955, light plastic balloons carrying printed material will be launched in 210 cities. A mass launching of 1400 balloons will be made in Milwaukee, Wisconsin. These activities are prelude to National Freedom Week, the Crusade for Freedom headquarters has announced. Pilots are further advised that at noon local time on February 22, 1955, the Civil Air Patrol aircraft will drop leaflets over approximately 200 cities. Local CAP officials have been asked to clear the project with local authorities in conjunction with National Freedom Week.

✓ FLIGHT INFORMATION MANUAL CORRECTIONS: Correct Flight Information Manual, Volume 8, dated May 25, 1954 as follows:

(4) Page 66- Delete the material concerning Radar Monitoring of Instrument Approaches and substitute the following:

At CAA radar locations, all instrument approaches on the ILS or other letdown facilities which are made within the coverage of the precision radar equipment (PAR) will be observed whenever the weather is below the basic VFR minimums (1000 and 3). Radar advisory information will be furnished to a pilot:

a. Automatically when an approach can be observed on PAR and the ceiling and/or visibility is below the highest circling minimum for the airport;or
b. When radar observation reveals a situation or an emergency which, in the opinion of the controller, can affect the safety of the flight.

Prior to starting final approach, the pilot will be advised of the frequency on which the advisories will be transmitted. This will normally be the ILS localizer voice channel. If radar advisories cannot be furnished for any reason, the pilot will be so advised.

Radar advisories will be terminated when the pilot reports contact or that he has the runway in sight.

RESTRICTED AREA AMENDMENT: The following Restricted Area Amendment No. 102 to Part 608- shall become effective on February 4, 1955. SEE ALSO PAGE 19.

(1) In Section 608 55, Moses Lake, Washington area (R-245, formerly D-245), published on July 16, 1949, in 14 F.R., 4297 and amended on March 17, 1950, in 15 F.R. 1510 is rescinded

(2) In Section 608.40, Oswego, New York, area (R-70 formerly D-70), published on March 17, 1950, in 15 F.R. 1510 and amended on September 26, 1950, in 15 F.R. 6472 is further amended by changing the "Using Agency" column to read: "First Air Force, Mitchell AFB, New York." SEE ALSO PAGE 19 OSWEGO REDESIGNATED.

ON-REQUEST REPORTING POINTS: Effective immediately the following on-request reporting points are designated, redesignated or cancelled as indicated:

DESIGNATED:

(1) COYLE INTSXN - the intersection Millville LFR northeast course with McGuire AFB LFR southeast course.

(2) PALUXY INTSXN - the intersection of the northwest course of the Waco, Texas, LFR and the 210° magnetic bearing from the Ft. Worth, Texas, LF Range.

(3) BRADY INTSXN - the intersection of the San Angelo, Texas, 101°magnetic radial and the Junction, Texas, 028° magnetic radial.

(4) BAYSHORE INTSXN - the intersection of the Miami, Florida 085° magnetic radial and the West Palm Beach, Florida 175° magnetic radial.

(5) LAUDERDALE INTSXN - the intersection of the Miami, Florida 032° magnetic radial and the West Palm Beach, Florida 175° magnetic radial.

(6) OTTWAY INTSXN - the intersection of the Tri-City, Tennessee 252° magnetic radial and the Asheville, N. C. 330° magnetic radial.

(7) KENDALL INTSXN - the intersection of the southeast course of the Miami, Fla., LF Range and 034° magnetic bearing from the Homestead AFB, Fla., LF range.

(8) YUMA INTSXN - the intersection of Tri-City, Tenn., 290° magnetic radial and Knoxville, Tenn., 054° magnetic radial.

(9) HINDSBORO, ILL. INTSXN - the intersection of the Vandalia, Illinois, VOR radial directed toward the Lafayette, Indiana, VOR and the Terre Haute, Indiana, VOR radial directed toward the Springfield, Illinois, VOR.

(10) KNOXVILLE, MISSOURI INTSXN - the intersection of the St. Joseph, Missouri, VOR 120° magnetic radial and the Kansas City, Missouri, VOR 068° magnetic radial.

(11) EUREKA INTSXN - the intersection York, Kentucky, VOR en route radial on Victor 174 with Parkersburg VOR en route radial on Victor 119.

(12) NORRISVILLE INTSXN - the intersection West Chester VOR en route radial on Victor 166 with Baltimore VOR en route radial on Victor 93.

REDESIGNATE

(1) WALNUT GROVE, W. VA. INTSXN - the intersection of Elkins, West Virginia, VOR en route radial on Victor 174 with the Charleston, West Virginia, VOR direct radial to Morgantown VOR.

(2) POTOMAC, VA. INTSXN - the intersection formed by Gordonsville VOR 062° magnetic radial with Herndon VOR direct radial to currently designated Potomac Intsxn.

(3) PARKTON, MD. INTSXN - the intersection to be formed by West Chester VOR 262° magnetic radial with Baltimore VOR direct radial to currently designated Parkton Intsxn.

(4) BONITA INTSXN- the intersection of W. Palm Beach, Fla., 013° mag radial and Vero Beach, Fla., 130° mag radial.

CANCEL

(1) HUMBOLDT INTSXN.

The following on-request reporting points are designated, redesignated or cancelled effective on March 15, 1955.

REDESIGNATE

(1) MILAN, MICH INTSXN - the intersection of the 230° magnetic (front) course of the Ypsilanti, (Willow Run) Michigan ILS localizer, the 276° magnetic radial of the Carleton, Michigan omnirange and the 354° magnetic radial of the Waterville, Ohio omnirange.

(2) BRIDGEWATER, MICH INTSXN - the intersection of the 233° magnetic radial of the Salem, Michigan, omnirange and the 297° magnetic radial of the Carleton, Michigan omnirng.

DESIGNATE

)1) FLINT, MICH. INTSXN - the intersection of the 070° magnetic radial of the Lansing, Michigan, omnirange and the 346° magnetic radial of the Salem, Michigan omnirange.

(2) MIDCRAFT, MICH. INTSXN - the intersection of the 050° magnetic (back) course of the Ypsilanti, Michigan, ILS localizer and the 101° magnetic radial of the Salem, Michigan, omnirange.

(3) BELLE, MICH. INTSXN - the intersection of the 101° magnetic radial of the Salem, Michigan, omnirange and the 028° magnetic radial of the Waterville, Ohio, omnirange.

(4) RIVERSIDE, MICH. INTSXN - the intersection of the 101° magnetic radial of the Salem Michigan, omnirange and the radial of the Cleveland, Ohio, omnirange directed toward the Windsor, Ontario, LF radio range.

(5) TILBURG, ONTARIO, CANADA INTSXN - the intersection of the 101° magnetic radial of the Salem, Michigan, omnirange and the 079° mag radial of the Carleton, Mich. omnirng.

(6) ELOISE, MICH. INTSXN - the intersection of the 032° magnetic (back) course of the Detroit, (Wayne-Major) Michigan, ILS localizer and the 124° magnetic radial of the Salem, Michigan, omnirange.

(7) ESSEX, ONTARIO, CANADA INTSXN - the intersection of the 079° magnetic radial of the Carleton, Michigan, omnirange and the 330° magnetic radial of the Cleveland, Ohio, omnirange.

(8) McGREGOR, ONTARIO, CANADA INTSXN - the intersection of the 124° magnetic radial of the Salem, Michigan, omnirange and the 079° magnetic radial of the Carleton, Michigan, omnirange.

(9) PELEE, ONTARIO, CANADA INTSXN - the intersection of the 081° magnetic radial of the Carleton, Michigan, omnirange and the 124° magnetic radial of the Salem, Michigan, omnirange and the 330° magnetic radial of the Cleveland, Ohio omnirange.

(10) ROCKWOOD, MICHIGAN INTSXN - the intersection of the 143° magnetic radial of the Salem, Michigan, omnirange and the 028° magnetic radial of the Waterville, Ohio, omnirange.

(11) DETROIT RIVER, MICHIGAN INTSXN - the intersection of the 143° magnetic radial of the Salem, Michigan, omnirange and the 081° magnetic radial of the Carleton, Michigan, omnirange.

(12) MIDDLE, OHIO INTSXN - the intersection of the 143° magnetic radial of the Salem, Michigan, omnirange and the 348° magnetic radial of the Mansfield, Ohio omnirange.

(13) DEERFIELD, MICH. INTSXN - the intersection of the 239° magnetic radial of the Carleton, Michigan, omnirange and the 354° magnetic radial of the Waterville, Ohio omnirange.

(14) OGDEN, MICH. INTSXN - the intersection of the 330° magnetic radial of the Waterville, Ohio, omnirange and the 239° magnetic radial of the Carleton, Michigan, omnirange.

(15) LYONS, OHIO INTSXN - the intersection of the 308° magnetic radial of the Waterville, Ohio, omnirange and the 239° magnetic radial of the Carleton, Michigan omnirange.

(16) PULASKI, OHIO INTSXN - the intersection of the 051° magnetic radial of the Fort Wayne, Indiana, omnirange and the 275° magnetic radial of the Waterville, Ohio, omnirange.

(17) EDGERTON, OHIO INTSXN - the intersection of the 037° magnetic radial of the Fort Wayne, Indiana, omnirange and the 275° magnetic radial of the Waterville, Ohio, omnirange.

(18) HUDSON, MICH. INTSXN - The intersection of the 308° magnetic radial of the Waterville, Ohio, omnirange and the 233° magnetic radial of the Salem, Michigan, omnirange.

(19) TIPTON, MICHIGAN INTSXN - the intersection of the 276° magnetic radial of the Carleton, Michigan omnirange and the 233° magnetic radial of the Salem, Michigan, omnirange

(20) SPRINGVILLE, MICH. INTSXN - the intersection of the 076° magnetic radial of the Litchfield, Michigan, omnirange and the 126° magnetic radial of the Lansing, Michigan, omnirange.

(21) WOLF LAKE, MICH. INTSXN - the intersection of the 126° magnetic radial of the Lansing, Michigan, omnirange and the 252° magnetic radial of the Salem, Michigan, omnirange.

(22) LESLIE, MICH. INTSXN - the intersection of the 276° magnetic radial of the Salem, Michigan, omnirange and the 126° magnetic radial of the Lansing, Michigan, omnirange.

(23) PERRYSVILLE, IND., INTSXN - the intersection of the Terre Haute, Indiana, omnirange radial directed toward the Peotone, Illinois omnirange and the Lafayette, Indiana omnirange radial directed toward the Vandalia, Illinois, omnirange.

(24) UNION CENTER, ILL. INTSXN - the intersection of the 253° magnetic radial of the Terre Haute, Indiana omnirange and the 291° magnetic radial of the Scotland, Indiana omnirange.

(25) MITCHELL, INDIANA INTSXN - the intersection of the 184° magnetic radial of the Indianapolis, Indiana, omnirange and the Scotland, Indiana, omnirange radial directed toward the Louisville, Kentucky, omnirange.

(26) BARRINGTON, ILL., INTSXN - the intersection of the 356° magnetic radial of the Naperville, Illinois, omnirange and the 323° magnetic radial of the Chicago, Ill., (Midway) Terminal omnirange (TVOR) and the 318° magnetic (front) course of the O'Hare, Illinois, ILS localizer.

(27) BIG RUN, ILL., INTSXN - the intersection of the 132° magnetic radial of the Naperville, Illinois, omnirange and the Joliet, Illinois, omnirange direct radial to the Chicago, Illinois (Midway) Terminal omnirange.

(28) GARY, IND., INTSXN - the intersection of the 087° magnetic radial of the Chicago Heights, Illinois, omnirange and the 132° magnetic (back) course of the Chicago, Illinois (Midway) ILS localizer.

(29) GLEN ELLYN, ILL. INTSXN - the intersection of the 020° magnetic radial of the Naperville, Illinois, omnirange and the 292° magnetic radial of the Chicago, Illinois, (Midway) Terminal omnirange.

(30) MATENO, ILL., INTSXN - the intersection of the 196° magnetic radial of the Chicago, Illinois (Midway) Terminal omnirange and the 309° magnetic radial of the Peotone, Illinois, omnirange.

✓ REDESIGNATED OSWEGO, NEW YORK RESTRICTED AREA: The following restricted area amendment No. 103 to Part 608- Restricted Areas shall become effective on February 25, 1955.

In Section 608.40, Oswego, New York, area , (R-70 formerly D-70), published on March 17, 1950 in 15 F.R. 1510 and amended on September 26, 1950, in 15 F.R. 6472 and on February 4, 1955, in 20 F.R. 758 is redesignated as follows: Beginning at latitude 43°37'00", longitude 78°00'00"; thence to latitude 43°24'00", longitude 78°00'00"; thence to latitude 43°24'00", longitude 76°45'00"; thence to latitude 43°30'00", longitude 76°25'00"; thence to latitude 43°34'00", longitude 76°23'00"; thence to latitude 43°45'00", longitude 76°23'00"; thence to latitude 43°45'00", longitude 76°30'00"; thence to latitude 43°37'00", longitude 76°45'00"; thence to latitude 43°37'00", longitude 78°00'00" to point of beginning. Designated Altitudes: Surface to Unlimited. Activities: Air-to-Air Gunnery, Antiaircraft & Artillery Firing. Time of Use: Daylight hours, 7 days a week (Weather conditions to be better than VFR as operations will not be conducted through or above an overcast). Controlling Agency: First AF, Mitchell AFB, N.Y. (Jointly used by AF, Army and Navy). Effective date: February 25, 1955.

✓ AERONAUTICAL CHART CORRECTION: U. S. Coast and Geodetic Survey RF Chart 5, dated December 8, 1954 and February 2, 1955, shows an MEA of 1,400 feet on Blue Civil Airway No. 30 between C. B. Ranch and Mertzon Intersections, Texas. Correct altitude is 4,000 feet.

VOR RECEIVER CHECK SIGNALS

Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods: (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator (FPDI) centered the omnibearing selector should read 0° with the to-from indication being "From" or the omnibearing selector should read 180° with the to-from indication read "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°. (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an individual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that should be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of ± 4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of Feb. 8, 1955, _ check points or facilitites have been established at the following airports (listed under city name).

Revisions to Instrument Approach Procedures

(NOTE: ALL DISTANCES ARE IN STATUTE MILES.)

NOTICE: **Instrument approach procedures are no longer published in the Flight Information Manual. The Airman's Guide currently publishes new and amended instrument approach procedures with the lowest landing and take-off minimums possible under the obstruction clearance requirements of the Regulations of the Administrator, Part 609. These procedures are applicable to all users. The IFR take-off or landing minimums shall not apply to military aircraft of the United States Armed Forces. The IFR landing minimums are applicable to all users except the military as noted above. The IFR take-off minimums are applicable to all users while conducting operations under the authority of Parts 40, 41, 42, 44, or 45 of the Civil Air Regulations, but are not presently applicable to users conducting operations under Part 43 of the Civil Air Regulations. ILS and GCA (PAR) straight-in landing minimums, formerly published no lower than 400-3/4, may in some instances be lowered to 200-1/2. Straight-in LFR, ADF and VOR landing minimums, formerly no lower than 500-1, may in some instances be lowered to 400-1. There are now three categories of aircraft minimums, namely those for (1) 75 mph or less - 2-engine or less, (2) more than 75 mph - 2-engine or less, and (3) more than 75 mph - more than 2-engine. All users are warned that the lowering of these minimums published in the Airman's Guide does not necessarily imply that obstructions have been lowered or removed.**

LOW FREQUENCY RANGE PROCEDURES

When an LFR instrument approach is conducted at the below named airport(s), it shall be in accordance with the following instrument approach procedure(s), unless an approach is conducted in accordance with a different procedure authorized by the Administrator for such airport(s). Initial approaches shall be made over specified routes. Minimum altitude(s) shall correspond with those established for en route operation in the particular area or as set forth below:

VHF OMNIRANGE (VOR) PROCEDURES

When a VOR instrument approach is conducted at the below named airport(s), it shall be in accordance with the following instrument approach procedure(s), unless an approach is conducted in accordance with a different procedure authorized by the Administrator for such airport(s). Initial approaches shall be made over specified routes. Minimum altitude(s) shall correspond with those established for en route operation in the particular area or as set forth below:

ALWAYS CHECK NOTICES TO AIRMEN SECTION

INSACS = Interstate Airway Communications Station/s (CAA)

VHF OMNI-RANGE: "Non-commissioned" VHF omni-ranges may lack certain items, such as monitoring or control equipment or may not have been flight-checked and are subject to shut-down at any time without notice. The courses may or may not be within the prescribed tolerances and the station is to be used accordingly.

VAR AND VOR MONITORING CLASSIFICATION FOR AIR TRAFFIC CONTROL PURPOSES: Category I (VAR) = Following conditions must be met: (A) The visual course alignment and signal level are monitored continuously. (B) The aural "A" or "N" sector signal is monitored continuously by the communicator at the associated INSACS. (C) The station identification is monitored continuously by the communicator at the associated INSACS. (D) The aural course alignment is monitored at least once each hour by the communicator at the associated INSACS. Category I (VOR) = Course alignment and signal level are monitored continuously. NOTE: Category I indicated by parenthetical (1). Category II (VAR only) = If all except (D) of the conditions of Category I are met. NOTE: Category II indicated by parenthetical (2). Category III = Facility monitored soley through use of automatic visual course and signal level monitor with automatic transfer unit. This category may permit VOR to be inoperative for a limited period before a notice to airmen is issued. Normally, VHF ranges which are not controlled by an INSACS, and located too distant from INSACS to be monitored with a VHF receiver will fall into Category III. NOTE: Category III indicated by parenthetical (3).

NOTE: Letters between range courses are quadrant identifiers, e.g., "90 YN 180", indicates the quadrant between the two courses is a yellow N quadrant. The letter immediately following a range course indicates whether the course is aural or visual, i.e., "Y" or "B", for yellow or blue, indicates visual: "A" or "N" aural. In the case of low frequency ranges, the A or N cited between two courses is the identification to be heard in the quadrant between those two courses.

RADIO CLASS DESIGNATIONS

AC. . . . . Approach Control Tower, CAA (transmits on voice channel of associated ranges and ILS in addition to frequencies listed)
B. . . . . Scheduled Broadcast Station (broadcasts weather at 15 and 45 minutes after the hour; Air Force Broadcasts, generally, 29 minutes)
C. . . . . Control Tower, CAA
CI. . . . . Control Tower, (City, County, Private, etc.)
D. . . . . Distantly controlled
DME. . . . Distance Measuring Equipment
FM. . . . . VHF fan marker (100 watts)
GCA. . . . Ground Controlled approach system
H. . . . . Non-directional radio beacon (homing), power 50 watts to less than 2000 watts
HH. . . . . Non-directional radio beacon (homing), power 2000 watts or more
ILS. . . . Instrument Landing System (voice on localizer channel)
J. . . . . L/MF (200-415 kc) voice facility on other than range frequency
LFM. . . . VHF fan marker, low powered (5 watts)
LMM. . . Compass locator station when installed at middle marker site
LOM. . . . Compass locator when installed at outer marker site
LVOR. . . Low power VOR (with standby equipment)
MH. . . . . Non-directional radio beacon (homing) power less than 50 watts
ML. . . . . Range (loop radiators), power less than 50 watts
MM. . . . VHF middle marker
MOR. . . . Low frequency omni-drectional range
MRA. . . . Range (adcock, vertical radiators), power 50 or more, but less than 150 watts
MRL. . . . Range (loop radiators), power 50 or more, but less than 150 watts
OM. . . . . VHF outer marker
P. . . . . Point-to-Point radio
RA. . . . . Range (adcock, vertical radiators), power 150 watts or more
RAPCON Radar Approach Control Center.
RL. . . . . Range (loop radiators), power 150 watts or more
S. . . . . Simultaneous range, homing and voice signals available. Inclusion suffix "W" indicates range and homing signals only
T. . . . . Teletype
TVOR. . . Low power VOR (no standby equipment) located on airport
TX. . . . . Principal teletype
V. . . . . Additional VHF voice feature on other than range frequency
VAR. . . . Visual-aural VHF range
VOR. . . . VHF omni-directional range (omni-range)
W. . . . . Without voice facilities on range frequency
Z. . . . . VHF station location marker at a range station

NOTES

1. Range courses are magnetic in-bearings
2. All CAA MH facilities operate continuously unless cited as follows: (on req)
3. All CAA ranges operate continuously. Those which are not manned continuously are cited in the remarks column with hours of operation in parentheses, e.g., (0600-2400)
4. VHF and LF/LMF ranges listed with the same identifier are controlled by the same INSACS. Due to space limitations the DTV and communication frequencies which are listed with the LF/LMF facility are not repeated with the VOR facility

Pilots are requested to indicate when calling C.A.A. airway communications stations and control towers the frequency on which the reply is expected.

RADAR AVAILABLE : How and Where

(2-21-55)

PAR = Precision Approach Radar. ASR = Airport Surveillance Radar. GCA = Ground Controlled Approach - Military Equivalent of Combined ASR and PAR Equipment. ARSR = Air Route Surveillance Radar. RAPCON = Radar Approach Control Center.

GROUND CONTROLLED APPROACHES - The only airborne equipment required for ground controlled approaches is a functioning radio transmitter and receiver. There are two types of ground controlled approaches - Precision and Surveillance.

PRECISION APPROACHES - Aircraft are guided to final approach to the designated instrument runway The final approach flight path on a precisionscope (PAR) is greatly expanded for increased accuracy and furnishes the controller with range, azimuth and altitude information. This permits the controller to accurately guide aircraft to touchdown on the runway.

SURVEILLANCE or ASR APPROACHES - Only the ASR scope is used and aircraft may be directed to any selected runway over approximately the same flight path the pilot would take if flying VFR. This scope furnishes range and azimuth information only. Since no altitude information is available to the controller, pilots must control their descent based on the glide angle desired, and the distance from the runway as furnished by the controller. Because ASR does not permit the same degree of accuracy as PAR, the weather minimums for this type of approach are at least as high as, and in some instances higher than, the regular circling minimums listed in the Flight Information Manual for the airport.

RADAR ARRIVAL AND DEPARTURE CONTROL - Radar is utilized by certain radar equipped facilities to control the flight paths of arriving or departing IFR aircraft for the purpose of expediting the flow of traffic. Aircraft operating on IFR flight plans will be afforded a minimum of three miles horizontal separation unless standard non-radar vertical, lateral or longitudinal separation exists. This should not be confused with Ground Controlled Approach (GCA) which is an instrument approach aid.

CAA RADAR UNITS - Operate continuously at the locations listed. Available to all pilots, civil and military. Contact associated CAA control tower on any frequency guarded for initial instructions, or in an emergency any CAA facility for information on nearest Radar Control. Weather minimums, associated runways and GCA procedures are listed in the Flight Information Manual.

RAPCON - At certain locations, the surveillance portion of Military RAPCONS is operated by the CAA and service is available to all aircraft. These are listed below as well as in "Air Navigation Radio Aids" section under proper location.

AIR FORCE AND NAVY GCA UNITS - Available to civil pilots in emergency or by prior arrangement with C.O. of respective facility.
Contact under IFR: Pilots desiring GCA assistance during IFR conditions should call the nearest air traffic control facility (radio, airways, or tower, etc.) requesting GCA and further instructions.
Contact under VFR: VFR check-out of training flights should be arranged locally through Base Operations or the Control Tower.
Emergency: When a receiver or transmitter difficulties exist, the tower may relay GCA approach instructions to the pilot, or the GCA operator may transmit, in blind, instructions for aircraft to make 360 degree turns for identification. In either case, instructions will be followed at the pilot's discretion.
After being inoperative, GCA units require 20 to 30 minutes for warming up. Pilots should anticipate requirements for GCA in flight planning and request alerting of GCA units as far in advance as possible.
Civil Minimums at military installations established by the CAA are 400' ceiling and 1 mile visibility except in emergency unless Air Force or Navy facility being used has higher minimums. Navy units are prepared to transmit on HF from 2,000 to 18,000 kc and receive any frequency from 1,500 to 9,050 kc to aid any plane in emergency.

RADAR FLIGHT ADVISORY SERVICE: This service to aircraft encountering severe weather condition may be obtained by requesting radar advisory through an appropriate ground station or direct ARTC communication. ARTC will determine if service can be provided and will request pilot to change to appropriate frequency for direct communication with radar. Radar station will be identified by "THIS IS AIR FORCE RADAR ADVISORY." All suggested vectors to circumnavigate storm areas will be of advisory nature and do not relieve pilot of responsibility for safety of aircraft. If advisory service cannot be furnished for any reason, the procedure word "UNABLE" will be used. This will terminate radar advisory service to the aircraft without further explanation. This service will be available in the following ARTC Flight Advisory Areas: Chicago, St. Louis, Minneapolis, Kansas City, Albuquerque San Antonio, Ft. Worth, Oakland, Denver, Great Falls, Los Angeles and the Knoxville ADIZ.

CAA OPERATED RADAR UNITS

NOTE: Transmitting frequencies below 118 mc. are not guarded. Other transmitting frequencies listed are guarded plus 122.5 mc and 3023.5 kc. Transmit and guard 121.5 mc all locations.

NOTICES TO AIRMEN

SPECIAL NOTICES

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so-called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the Office of Aviation Information, Attention: W-52, CAA, Washington 25, D.C.)

Permanent airport data changes (as differentiated from temporary hazardous conditions) should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide.

NEW AIR TRAFFIC CLEARANCE PHRASEOLOGY ADOPTED: The phrase "VIA FLIGHT PLANNED ROUTE" has been adopted for use in air traffic clearances and may be used to replace the detailed description of any portion of the route of flight that is identical to the route filed by the pilot. IFR flight plans filed by pilots must contain the complete route of flight and must be relayed to air traffic control unchanged in order for this phraseology to be successfully used.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft, 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shutdown, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical location. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert of these apparent vagaries.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations and outer compass locators).

Omniranges and outer compass locators where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification: e. g. Long Beach omni (voice) .-.. --. -... (LGB in Code).

For omniranges, as in the example given above, the normal voice identification consists of the name of the omni followed by the word "omni". However, if the omnirange is unattended, that is, if no facility for providing air-ground communications services is associated with the omnirange, the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

NAUTICAL MILE AND STATUTE MILE ABBREVIATIONS: The following abbreviations have been adopted for use in the Airmen's Guide: "n miles" or "n mi" for nautical miles; "s miles" or "s mi" for statute miles.

✓ CIVIL USE OF MILITARY FIELDS: U. S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission.

In the case of Air Force Bases, pilots must have on file with Headquarters USAF a "HOLD HARMLESS" AF form 180 and in their possession a properly signed and executed AF form 181 permit. Application for these forms may be made to: Assistant Chief of Staff, Installations, HQ, USAF, Washington 25, D.C. This regulation will be strictly enforced.

For Naval Installations, prior permission should be obtained from the Chief of Naval Operations (OP-532) Department of the Navy, Washington 25, D.C.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

✓ IFR POSITION REPORTS: To provide additional information to air traffic control for route of flight verification purposes, effective March 22, 1955, IFR position reports should include the following items: (1) Identification. (2) Position. (3) Time. (4) Altitude. (5) Type of flight plan. (6) ETA over next reporting point. (7) The name only of the next succeeding reporting point along the route of flight. (8) Remarks, when required. EXAMPLE: An aircraft operating along Victor Airway 30 between Pittsburgh and Minneapolis would make the following report when over Litchfield, Michigan: AIR FORCE SIX TWO ONE EIGHT FIVE OVER LITCHFIELD FIVE SIX AT EIGHT THOUSAND INSTRUMENT FLIGHT PLAN ESTIMATING PULLMAN ONE FOUR ONE EIGHT MILWAUKEE.

ATOMIC ENERGY COMMISSION CONDUCTING SERIES OF TESTS: Starting about mid-February 1955, the Atomic Energy Commission will conduct at its Nevada test site a series of atomic tests. The series will conform generally with those previously held in Nevada. Operators of highly sensitive airborne prospecting equipment should take special precautions and should communicate with U.S. Atomic Energy Commission, Division of Raw Materials offices in Denver and Grand Junction, Colorado or in Salt Lake City, Utah for specific information on location of areas of increased radioactivity after each test is announced in the local press.

✓CIVIL AIRWAY, CONTROL AREA, CONTROL AREA EXTENSION, CONTROL ZONE AMENDMENTS: Effective 0001 EST, March 15, 1955, unless otherwise advised the following civil airways, control areas, control area extensions and control zones are amended as follows:

Part 600 - Amendment 50: Amendment 48 of Regulations of the Administrator, Part 600, designating certain civil airway alterations, was published in the Airman's Guide, dated January 11, 1955, and in the Federal Register on January 28, 1955. However, subsequent to the publication thereof it has been found necessary to redesignate certain of the civil airway designations, having an effective date of March 15, 1955, contained in that amendment. The resdesignations will also become effective 0001, EST., March 15, 1955 and are as follows:

CIVIL AIRWAYS: (1) VOR civil airway No. 6 (Oakland, Calif., to New York, N.Y.) is amended by changing the portion between the Naperville, Ill., omnirange station and the South Bend, Ind., omnirange station to read: "Naperville, Ill., omnirange station; South Bend Ind., omnirange station."

(2) VOR civil airway No. 8 (Long Beach, Calif., to Washington, D.C.) is amended by changing the portion between the Naperville, Ill ., omnirange station and the Chicago Heights, Ill., omnirange station to read: "Naperville, Ill., omnirange station; intersection of the Naperville omnirange 090° true and the Chicago Heights, Ill., omnirange 342° true radials; Chicago Heights, Ill., omnirange station."

(3) VOR civil airway No. 12 (Santa Barbara, Calif., to Philadelphia, Pa.) is amended by changing the portion between the Vandalia, Ill., omnirange station and the Terre Haute, Ind., omnirange station to read: "Vandalia, Ill., omnirange station, including a north alternate via the intersection of the St. Louis omnirange 032° true and the Vandalia omnirange 273° true radials; Terre Haute, Ind., omnirange station, including a north alternate via the intersection of the Vandalia omnirange 054° true and the Terre Haute omnirange 283° true radials

(4) VOR civil airway No. 14 (Roswell, N. Mex., to Boston, Mass.) is amended by changing the portion between the Vandalia, Ill., omnirng stn and the Terre Haute, Ind., omnirng stn to read: "Vandalia, Ill., omnirng stn, including a north alternate via the intersection of the St. Louis omnirng 032° true and the Vandalia omnirng 273° true rad., Terre Haute, Ind. omnirng stn, including a north alternate via the intersection of Vandalia omnirng 054°true and the Terre Haute omnirng 283°true radials.

(5) VOR civil airway No 47 (Louisville, Ky., to Detroit, Mich.) is amended by changing all after the Waterville, Ohio, omnirng stn to read: "Waterville, Ohio, omnirng stn; intersection of the Waterville omnirng 351° true rad and the Detroit Willow Run Arpt ILS lclzr 228° true course; Detroit, Mich., Willow Run Arpt ILS lclzr; to the point of intersection of the Detroit Willow Run Arpt lclzr 047°true course and the Salem, Mich. omnirng 098° true radial.

(6) VOR civil airway No. 53 (Charleston, S C. to Milwaukee, Wis.) is amended by changing all after the Chicago, Ill., Midway Airport terminal omnirange station; intersection of the Chicago Midway Airport terminal omnirange 325° true and the Naperville, Ill., omnirange 358° true radials; intersection of the Naperville omnirange 358° true and the Milwaukee omnirange 215° true radials; to the Milwaukee, Wis., omnirange station."

(7) VOR civil airway No. 126 (Chicago, Ill., to New York, N.Y.) is amended by changing all before the Goshen, Ind., omnirange station to read: "From the point of intersection of the Naperville, Ill., omnirange 090° true and the Chicago Heights omnirange 342° true radials via the Chicago Heights, Ill., omnirange station; Goshen, Ind., omnirange station."

(8) VOR civil airway No. 180 (Moline, Ill., to Dixon, Ill.) is revoked."

Part 601 - Amendment 50: Amendment 48 of Regulations of the Administrator, Part 601, designating certain control area, control zone and reporting point alterations, was published in the Airman's Guide dated January 11, 1955 and in the Federal Register on January 28, 1955. However, subsequent to the publication thereof it has been found necessary to redesignate certain of the control area designations, having an effective date of March 15, 1955, contained in that amendment. The redesignations will also become effective 0001, EST March 15, 1955 and are as follows:

CONTROL AREAS: (1) VOR civil airway No. 53 (Charleston, S. C., to Milwaukee, Wis.) is amended to read: "All of VOR civil airway No. 53 including west alternates."

(2) VOR civil airway No. 180 (Moline, Ill., to Dixon, Ill.) is revoked.

Part 600- Amendment No. 51: CIVIL AIRWAYS: (1) VOR civil airway No. 7 (Miami, Fla., to Green Bay, Wis.) is amended to read: "From the Miami, Fla., omnirange station via the Fort Myers, Fla., omnirange station, including a west alternate via the intersection of the Miami omnirange 274° true and the Fort Myers omnirange 133° true radials; Lakeland, Fla., omnirange station, including an east alternate via the intersection of the Fort Myers omnirange 036° true and the Lakeland omnirange 162° ture radials; Cross City, Fla., omnirange station, including a west alternate from the Fort Myers omnirange station to the Cross City, omnirange station via the Tampa, Fla., omnirange station and the intersection of the Tampa, omnirange 013° true and the Cross City omnirange 150° true radials; Tallahassee, Fla., omnirange station, including a west alternate via the intersection of the Cross City omnirange 287° true and the Tallahassee omnirange 151° true radials; Marianna, Fla., omnirange station; intersection of the Marianna omnirange 333° true and the Montgomery omnirange 137° true radials; to the Montgomery, Ala., omnirange station, including a west alternate from the Marianna omnirange station to the Montgomery omnirange stn via the intersection of the Marianna omnirange 303° and the Montgomery omnirange 192° true radials. ✓ RESTRICTED AREA AMENDMENTS: The following Restricted Area Amendments shall become effective on March 15, 1955.

AMENDMENT NO. 104 to PART 608-

(1) In Section 608.36, Nevada, there occurs a small part of California Restricted Area Complex (R-484) and Saline Valley Restricted Area (R-485). For convenience these areas have been listed under the State of California. See Section 608.14 (California) for descriptions.

(2) In Section 608.14, a Complex, California area (R-484) is added to read: Name and Location: Complex, California (R-484). Description by Geographical Coordinates: Beginning at latitude 37°12'00", longitude 117°20'00"; thence to latitude 35°34'00", longitude 116°23'00"; thence to latitude 35°28'35", longitude 116°18'45"; thence to latitude 35°18'45", longitude 116°18'45"; thence southwest along the boundary of Amber civil airway No. 2, thence to latitude 35°07'00", longitude 116°34'00"; thence to latitude 35°07'00", longitude 116°47'45"; thence to latitude 35°08'50", longitude 116°48'40"; thence to latitude 35°06'30", longitude 116°58'40"; thence to latitude 34°53'30", longitude 117°11'50"; thence to latitude 34°50'20", longitude 117°32'00"; thence to latitude 34°48'30", longitude 117°32'00"; thence along the boundary of Green civil airway No. 4 to latitude 34°48'00", longitude 117°35'00"; thence to latitude 34°48'00", longitude 118°01'00"; thence to latitude 34°49'40", longitude 118°05'45"; thence to latitude 34°51'30", longitude 118°05'45"; thence to latitude 35°00'00", longitude 118°35'00"; thence to latitude 37°12'00", longitude 118°35'00"; thence to point of beginning. Designated Altitudes: 20,000 feet MSL to unlimited except within the boundaries of established Restricted Areas wherein the designated altitude will be from the surface to unlimited. Time of Designation: Unlimited. Using Agency: For the area from 20,000 feet MSL to unlimited, except within the boundaries of existing Restricted Areas NOTS-Inyokern. (Note: A small portion in the northeast corner of this Restricted Area is actually found in Nevada, but for convenience the entire area has been listed under California).

(3) In Section 608.14, a Saline Valley, California, area (R-485) is added to read: Name and Location: Saline Valley, Calif., (R-485). VOR RECEIVER CHECK SIGNALS

1/ Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods: (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator (FPDI) centered the omnibearing selector should read 0° with the to-from indication being "From" or the omnibearing selector should read 180° with the to-from indication read "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°. (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an individual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that should be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of ± 4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of Feb. 21, 1955, check points or facilitites have been established at the following airports (listed under city name).

Revisions to Instrument Approach Procedures

(NOTE: ALL DISTANCES ARE IN STATUTE MILES UNLESS OTHERWISE INDICATED)

NOTICE: Instrument approach procedures are no longer published in the Flight Information Manual. The Airman's Guide currently publishes new and amended instrument approach procedures with the lowest landing and take-off minimums possible under the obstruction clearance requirements of the Regulations of the Administrator, Part 609. These procedures are applicable to all users. The IFR take-off or landing minimums shall not apply to military aircraft of the United States Armed Forces. The IFR landing minimums are applicable to all users except the military as noted above. The IFR take-off minimums are applicable to all users while conducting operations under the authority of Parts 40, 41, 42, 44, or 45 of the Civil Air Regulations, but are not presently applicable to users conducting operations under Part 43 of the Civil Air Regulations. ILS and GCA (PAR) straight-in landing minimums, formerly published no lower than 400-3/4, may in some instances be lowered to 200-1/2. Straight-in LFR, ADF and VOR landing minimums, formerly no lower than 500-1, may in some instances be lowered to 400-1. There are now three categories of aircraft minimums, namely those for (1) 75 mph or less - 2-engine or less, (2) more than 75 mph - 2-engine or less, and (3) more than 75 mph - more than 2-engine. All users are warned that the lowering of these minimums published in the Airman's Guide does not necessarily imply that obstructions have been lowered or removed.

VHF OMNIRANGE (TVOR) PROCEDURES

When a TVOR instrument approach is conducted at the below named airport(s), it shall be in accordance with the following instrument approach procedure(s), unless an approach is conducted in accordance with a different procedure authorized by the Administrator for such airport(s). Initial approaches shall be made over specified routes. Minimum altitude(s) shall correspond with those established for en route operation in the particular area or as set forth below:

GROUND CONTROLLED APPROACH SYSTEM PROCEDURES

When a GCA instrument approach is conducted at the below named airport(s), it shall be in accordance with the following instrument approach procedure(s), unless an approach is conducted in accordance with a different procedure authorized by the Administrator for such airport(s). Initial approaches shall be made over specified routes. Minimum altitude(s) shall correspond with those established for en route operation in the particular area or as set forth below. Positive identification must be established with the ground controller. From initial contact with GCA to final authorized landing minimums, the instructions of the GCA controller are mandatory except when (A) visual reference with the ground is established on final approach at or before descent to the authorized landing minimums, or (B) at pilot's discretion if it appears desirable to discontinue the approach.

The AIRMAN'S GUIDE is issued every two weeks. This issue includes all data on record as of 0001 E.S.T. on the above date. For later information consult Teletype NOTAMS.

U. S. DEPARTMENT OF COMMERCE
CIVIL AERONAUTICS ADMINISTRATION
OFFICE OF AVIATION INFORMATION

✓ Indicates New or Revised Special Notices

The Airman's Guide covers primarily two broad fields of civil airport information, namely so-called permanent data changes and temporary hazardous conditions. Permanent airport data refer to new airports or changes in field layout or servicing, lighting, or permanent obstructions on existing airports. Temporary hazardous conditions refer to conditions that make such airports temporarily unusable or usable only with caution. Such hazardous conditions could be, for example, a field closed because of floods, spring thaws, or construction, or merely a burned-out obstruction light or a runway partially unusable because of construction.

Since the aeronautical public should be immediately advised of hazardous conditions, reporters should utilize the CAA Airway Communications Stations. The item to be reported, therefore, should either be telephoned or mailed to the nearest communications station for dissemination as a Notam and for further transmission to the publishers of the Airman's Guide. (If this is not feasible the items should be reported directly to the Office of Aviation Information, Attention: W-52, CAA, Washington 25, D.C.)

Permanent airport data changes (as differentiated from temporary hazardous conditions) should be reported to the appropriate CAA Regional Office for coordination before they are included in the Airman's Guide.

NEW AIR TRAFFIC CLEARANCE PHRASEOLOGY ADOPTED: The phrase "VIA FLIGHT PLANNED ROUTE" has been adopted for use in air traffic clearances and may be used to replace the detailed description of any portion of the route of flight that is identical to the route filed by the pilot. IFR flight plans filed by pilots must contain the complete route of flight and must be relayed to air traffic control unchanged in order for this phraseology to be successfully used.

VHF INSACS-TO-PRIVATE AIRCRAFT CHANNELS: The national VHF channel for transmission from INSACS-to-private aircraft 122.2 mc was partially implemented beginning August 1, 1951. (The companion aircraft-to-INSACS frequency is 122.1 mc). Eventually all INSACS will transmit on 122.2 mc but in the meantime VHF reply to private aircraft will be furnished on the VHF range voice channel at INSACS which have not yet commissioned 122.2 mc. Pilots should consult the Airman's Guide and current Notams for information on frequencies available at specific stations. The frequency upon which the pilot expects reply should be specified in the initial call.

When an INSACS is unable to reply on the VHF range voice channel because of equipment failure or maintenance shutdown, reply will be made on 121.5 mc. A small number of INSACS have not yet installed transmitting service on 121.5 mc. At these locations, the reply on 121.5 mc will be made by an adjacent control tower. Therefore, when a pilot calling such station has reason to believe that the VHF range voice channel is not operating, he should request reply on 121.5 mc.

USE OF OMNIRANGE: The effectiveness of the omnirange (VOR) depends upon proper use and adjustment of both the ground and airborne equipment. The accuracy of course alignment of the omnirange over 360° azimuth is excellent when compared to that of the L/MF range, being generally within two degrees (plus or minus). On certain stations, some sectors may contain slightly larger errors, but no course published as usable in the Airman's Guide will be displaced more than 3-1/2 degrees from its theoretical location. Certain minor irregularities may be observed in using VOR facilities, such as apparent course roughness, infrequent brief flag alarm activity, course deflections and/or limited distance range. Pilots flying over unfamiliar routes are cautioned to be on the alert of these apparent vagaries.

DVFR FLIGHT PLANS: When an IFR flight plan is cancelled, a DVFR flight plan should be filed if the provisions of Part 620 of the Regulations of the Administrator will be applicable to any portion of the remainder of the flight.

AUTOMATIC VOICE IDENTIFICATION: Voice identification has been added to numerous air navigational facilities (omnirange stations and outer compass locators).

Omniranges and outer compass locators where voice identification is functioning are designated in the ANRA pages by an asterisk (*) in the "class identification" column. The transmission consists of a voice announcement alternating with the usual Morse Code identification: e. g. Long Beach omni (voice) .-.. --- -... (LGB in Code).

For omniranges, as in the example given above, the normal voice identification consists of the name of the omni followed by the word "omni". However, if the omnirange is unattended, that is, if no facility for providing air-ground communications services is associated with the omnirange, the word "unattended" will precede the word "omni". Example: AIRVILLE UNATTENDED OMNI.

TRANSMISSION OF "V" BY VAR RANGES: The letter "V" is transmitted by all VAR ranges. It precedes the usual location identifier and is separated from it by a short space. It is intended to enable pilots to distinguish instantly between the aural directional signals of VAR ranges, and those of low or medium frequency ranges, ILS and VORs located in the same general area. It will, for example, guard against the possibility of an error occuring through accidental connection of a pilot's headset to the wrong receiver. The "V" is transmitted at an appreciable higher rate of speed than the location identifier.

NAUTICAL MILE AND STATUTE MILE ABBREVIATIONS: The following abbreviations have been adopted for use in the Airman's Guide; "n miles" or "n mi" for nautical miles; "s miles" or "s mi" for statute miles.

CIVIL USE OF MILITARY FIELDS: U.S. Air Force and Navy Fields are open to civil fliers only in emergency or with prior permission.

In the case of Air Force Bases, pilots must have on file with Headquarters USAF a "HOLD HARMLESS" AF form 180 and in their possession a properly signed and executed AF form 181 permit. Application for these forms may be made to: Assistant Chief of Staff, Installations, HQ, USAF, Washington 25, D.C. This regulation will be strictly enforced.

For Naval Installations, prior permission should be obtained from the Chief of Naval Operations (OP-532) Department of the Navy, Washington 25, D.C.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

IFR POSITION REPORTS: To provide additional information to air traffic control for route of flight verification purposes, effective March 22, 1955, IFR position reports should include the following items: (1) Identification. (2) Position. (3) Time. (4) Altitude. (5) Type of flight plan. (6) ETA over next reporting point. (7) The name only of the next succeeding reporting point along the route of flight. (8) Remarks, when required.
EXAMPLE: An aircraft operating along Victor Airway 30 between Pittsburgh and Minneapolis would make the following report when over Litchfield, Michigan: AIR FORCE SIX TWO ONE EIGHT FIVE OVER LITCHFIELD FIVE SIX AT EIGHT THOUSAND INSTRUMENT FLIGHT PLAN ESTIMATING PULLMAN ONE FOUR ONE EIGHT MILWAUKEE.

ATOMIC ENERGY COMMISSION CONDUCTING SERIES OF TESTS: Starting about mid-February 1955, the Atomic Energy Commission will conduct at its Nevada test site a series of atomic tests. The series will conform generally with those previously held in Nevada. Operators of highly sensitive airborne prospecting equipment should take special precautions and should communicate with U.S. Atomic Energy Commission, Division of Raw Materials offices in Denver and Grand Junction, Colorado or in Salt Lake City, Utah for specific information on location of areas of increased radioactivity after each test is announced in the local press.

SPURIOUS GLIDE SLOPE INDICATIONS: CAA glide slope facilities are intended to provide reliable glide slope signals for use in conjunction with the front course of the ILS localizer. Glide slope signals may be received in other azimuths (because of stray radiation from the antennas and reflections from nearby objects) which may in some cases be sufficient to activate the airborne warning flag. Any glide slope needle activity in these other azimuths should be disregarded.

All pilots are particularly cautioned to ignore glide slope indications when making back course localizer approaches. All CAA approved procedures for back course approaches are limited to use of the localizer portion of the ILS. Any attempt to fly spurious glide slope indications on such back course approaches could result in hazardous operations.

RESTRICTED AREA AMENDMENTS: The following Restricted Area Amendments shall become effective as indicated:

AMENDMENT NO. 105-PART 608-
(March 7, 1955)

(1) In Section 608.51, the Del Rio, Texas, Laughlin AFB, areas, (R-462, R-463, and R-464) published on August 12, 1954, in 19 F.R. 5085 and amended on September 10, 1954, in 19 F.R. 5861, are rescinded.

(2) In Section 608.40, the Oswego, New York, area (R-70) amended on February 9, 1955, in 20 F.R. 1072, is further amended by changing the "Time of Designation" column to read: "Daylight hours only, 7 days a week."

AMENDMENT NO. 106 to PART 608-
(March 25, 1955)

(1) In Section 608.48, the Shaw Air Force Base, Sumter, South Carolina area (R-384 formerly D-384), published on October 6, 1951 in 16 F.R. 10204 is amended by substituting the name "Poinsett" for "Shaw Air Force Base", and changing the "Name and Location (Chart)" column to read: "Poinsett (R-384) Sumter (Savannah Chart)".

LOCATION IDENTIFIERS: The following changes affect the use of location identifiers:

CDU	•	Coeur d'Alene, Idaho (Assignment)
GAB	•	Gabbs, Nev., Gabbs Airport (Assignment)
IDO	•	Indio, Calif., Shavers Summit Airport (Assignment)
MCR	•	Jackson, Tenn., (Assignment)

REDESIGNATION OF AIRWAYS AND COMPULSORY REPORTING POINTS IN ALASKA: The following redesignation of airways and compulsory reporting points shall become effective 0001 EST March 29, 1955:

(1) That portion of controlled Red Airway No. 40, between the Anchor Point intersection and the Merrill range will be redesignated Green Airway No. 8.

(2) That portion of controlled Green Airway No. 8, between the Homer range and the Anchorage range will be redesignated as Red Airway No. 40.

(3) That portion of controlled Green Airway No. 8, between the Anchor Point intersection and the Homer range will be redesignated as Blue Airway No. 65.

(4) Compulsory reporting points Kenai range, and Delta intersection will be on Green Airway No. 8.

(5) Compulsory reporting points Homer range, Skilak intersection and Anchorage range will be on Red Airway No. 40.

All minimum enroute altitudes and reporting points will remain as currently depicted on Coast and Geodetic Survey RF Chart No. 106.

NORFOLK, VIRGINIA CONTROL AREA: Effective immediately the Norfolk control area is defined as follows:

The Norfolk Control Area - a 55 statute mile radius of the southern tip of Newport News, Virginia latitude 36-57-44N, longitude 76-24-44W in addition to; Victor Airway 1 from 55 statute mile boundary to the New York control boundary 12 statute miles SSW of Salisbury, Maryland VOR range; Blue Airway 23 from 55 statute mile boundary to Chincoteaque, Va., NAAS range including control zone and area extension at Chincoteaque, Va. NAAS; control 1181 from Weeksville NAF, North Carolina range to Manteo FM; Blue Airway 56 from Sharps Intersection to a point 10 statute miles north; Red Airway 19 from Sharps Intersection to a point 10 statute miles northwest.

AIR ROUTE TRAFFIC CONTROL BOUNDARY: Effective March 15, 1955 the Memphis-Indianapolis ARTC boundary on Victor 57 will be established 25 statute miles north of Bowling Green, Kentucky.

ON-REQUEST REPORTING POINTS: Effective immediately the following on-request reporting points are designated, redesignated or cancelled as indicated:

DESIGNATED

(1) ADDYSTON INTSXN - (Formerly Cleves Intsxn) - the intersection Cincinnati ILS north course with 092° magnetic bearing to Cincinnati LFR station.

(2) LAURENS INTSXN - the intersection of the Anderson, S.C., VOR 078° magnetic radial and a 140° magnetic bearing from the Greenville, S.C., LF range.

(3) HONEA INTSXN - the intersection of the south course of the Greenville, S.C., LF range and the Anderson, S.C. VOR 078° magnetic radial.

(4) PROSPECT, WISC. INTSXN - the intersection of the Milwaukee, Wisconsin VOR 283° magnetic radial (Victor 2) and the Janesville, Wisconsin VOR 057° magnetic radial.

(5) AIR CITY, WISC. INTSXN - the intersection of the Milwaukee, Wisconsin, VOR 177° magnetic radial (Victor 7) and the Janesville, Wisconsin, VOR 079° magnetic radial.

(6) RACINE, WISC. INTSXN - the intersection of the Milwaukee, Wisconsin VOR 115° magnetic radial and the Janesville, Wisconsin, 075° magnetic radial.

(7) BRIAR HILL INTSXN - the intersection Mansfield, Ohio, VOR direct radial to Morgantown VOR with Columbus, Ohio, VOR en route radial on Victor 43.

(8) MOOREFIELD INTSXN - the intersection Mansfield, Ohio, VOR direct radial to Morgantown VOR with Wheeling VOR en route radial on Victor 12.

(9) CAMERON INTSXN - the intersection Morgantown, West Virginia, VOR direct radial to Mansfield VOR with Pittsburgh VOR en route radial on Victor 35.

(10) PORTER INTSXN - the intersection Wheeling, West Virginia, VOR direct radial to Elkins VOR with Pittsburgh VOR en route radial on Victor 35.

(11) METZ INTSXN - the intersection Morgantown, West Virginia, VOR en route radial on Victor 44 with Elkins VOR direct radial to Wheeling VOR.

(12) CHAPLIN INTSXN - the intersection Louisville, Kentucky, VOR 122° with Lexington VOR 264° magnetic radials.

(13) LUVERNE INTSXN - the intersection of Marianna, Fla. (VOR) 300° and the Montgomery, Ala. (VOR) 189° magnetic radials.

(14) CANFIELD INTSXN - intersection of Youngstown, Ohio 199° magnetic radial with 070° magnetic bearing to the Hubbard "H" facility.

(15) ESSEX INTSXN - the intersection Baltimore LFR north course with Baltimore VOR 052° magnetic radial.

(16) MCCLURE INTSXN - the intersection Waterville, Ohio VOR 254° magnetic radial with a 024° magnetic bearing to Toledo ILS-LOM.

(17) HOLLAND INTSXN - the intersection Waterville, Ohio, VOR 351° magnetic radial with a 249° magnetic bearing on the Toledo ILS-LMM.

(18) HARBOR VIEW INTSXN - the intersection Waterville, Ohio, VOR 020° magnetic radial with Toledo LFR north course.

CHANGE

(1) CEDARVILLE INTSXN - (Formerly WALNUT GROVE INTSXN.)

CANCELLED

(1) WILMER INTSXN - the intersection of the Dallas, Texas VOR 169° magnetic radial and the Mineral Wells, Texas, VOR 086° magnetic radial.

(2) PEORIA INTSXN - the intersection 184° magnetic radial Bradford and 255° magnetic radial Pontiac.

REDESIGNATED

(1) MILAN, MICH., INTSXN - the intersection of the 230° magnetic (front) course of the Ypsilanti, Michigan, (Willow Run) ILS localizer, the Carleton, Michigan, omnirange radial directed toward the Litchfield, Michigan, omnirange and the Waterville, Ohio, omnirange radial directed toward this intersection (approximately 357° magnetic).

(2) PELEE, ONTARIO, CANADA INTSXN - the intersection of the Carleton, Michigan, omnirange radial directed toward the Perry, Ohio, nondirectional radio beacon, the Cleveland Ohio, omnirange radial directed toward the Windsor, Ontario, low frequency radio range and the Salem, Michigan, omnirange radial directed toward the intersection of the Carleton, Michigan - Cleveland, Ohio omnirange radials.

(3) DETROIT RIVER, MICHIGAN INTSXN - the intersection of the Salem, Michigan omnirange 143° magnetic radial and the Carleton, Michigan, omnirange radial directed toward the Perry, Ohio non-directional radio beacon.

(4) TIPTON, MICHIGAN INTSXN - the intersection of the Carleton, Michigan, omnirange radial directed toward the Litchfield, Michigan, omnirange and the Salem, Michigan, omnirange 233° magnetic radial.

(5) SPRINGVILLE, MICHIGAN INTSXN - the intersection of the Carleton, Michigan, omnirange radial directed toward the Litchfield, Michigan omnirange and the Lansing, Michigan omnirange 150° magnetic radial.

(6) WOLF LAKE, MICHIGAN INTSXN - the intersection of the Salem, Michigan, omnirange radial directed toward the Litchfield, Michigan, omnirange and the Lansing, Michigan 150° magnetic radial.

(7) LESLIE, MICHIGAN, INTSXN - the intersection of the Salem, Michigan omnirange radial directed toward the Pullman, Michigan omnirange and the Lansing, Michigan omnirange 150° magnetic radial.
(8) EDDY INTSXN - the intersection Wilkes-Barre, Pa., VOR direct radial to Albany VOR with Binghamton VOR en route radial on Victor 34.

NON-STANDARD HOLDING PATTERNS: Effective immediately the following non-standard holding patterns are established:
(1) PROSPECT, WISC. INTSXN - direction of holding - W on 283° magnetic radial; direction of turn - RIGHT; time - 1 minute; minimum altitude - 2300'.
(2) AIR CITY, WISC. INTSXN - direction of holding - S on 177° magnetic radial; direction of turn - RIGHT; time- 1 minute; minimum altitude - 2100'.
(3) RACINE, WISC. INTSXN - direction of holding - SE on 115° magnetic radial; direction of turn -RIGHT; time - 1 minute; minimum altitude - 3000'.
(4) BARRINGTON INTSXN - direction of holding - N on Naperville VOR 356° magnetic radial; direction of turn - RIGHT; time - 1 minute; minimum altitude - 2200'.
(5) BIG RUN INTSXN - direction of holding - SW on Midway TVOR radial direct toward Joliet VOR; direction of turn - RIGHT; time - 1 minute; minimum altitude - 2000'.
(6) HOBART INTSXN - direction of holding - E on Chicago Heights VOR 087° magnetic radial; direction of turn - RIGHT; time - 1 minute; minimum altitude - 2000'.
(7) GLEN ELLYN INTSXN - direction of holding - NW on Chicago TVOR 292° magnetic radial; direction of turn - RIGHT; time - 1 minute - minimum altitude 2500'.
(8) WOODSTOCK INTSXN - direction of holding - S on Naperville VOR 336° magnetic radial; direction of turn - RIGHT; time - 1 minute; minimum altitude - 2500'.
(9) NAPERVILLE VOR- direction of holding - W on Naperville VOR 268° magnetic radial; direction of turn - RIGHT; time - 2 minutes; minimum altitude - 2100'.
(10) O'HARE ILS LOM - direction of holding - NW on ILS front course; direction of turn- RIGHT; time - 1 minute; minimum altitude - 2500'.
(11) CHICAGO ILS LOM - direction of holding - NW on ILS front course; direction of turn RIGHT; time - 1 minute; minimum altitude - 2300'.
(12) CHICAGO HEIGHTS VOR - direction of holding - E on Chicago Heights 087° magnetic radial; direction of turn - RIGHT; time - 2 minutes; minimum altitude - 2000'.
(13) KEDZIE "H" FACILITY - direction of holding - SE on Chicago ILS back course; direction of turn - RIGHT; time - 1 minute - minimum altitude - 2000'.
(14) BEACON INTSXN - direction of holding - NE on Naperville VOR 062° magnetic radial; direction of turn - RIGHT; time - 1 minute; minimum altitude - 2300'.
(15) ST. ALBANS INTSXN - direction of holding - NE of intersection, E side; direction of turn- LEFT; time - 2 minutes; minimum altitude - 3,000'.
(16) LORING, MAINE, AFB "MH" FACILITY- direction of holding - N on 190° magnetic bearing inbound E side; direction of turn - LEFT; time - 2 minutes; minimum altitude-2,000'
(17) PROVIDENCE, RHODE ISLAND, LFR STATION- direction of holding - SW course W side, direction of turn - LEFT; time - 1 minute; minimum altitude - 1600'.
(18) PROVIDENCE, RHODE ISLAND, ILS-LOM - direction of holding - SW of LOM, W side; direction of turn - LEFT; time - 1 minute; minimum altitude 1600'.

---

(19) McCLURE INTSXN - direction of holding - SW of intersection; direction of turn - RIGHT; time - 1 minute; minimum altitude 1900'.
(20) HOLLAND INTSXN - direction of holding - NE of intersection; direction of turn - RIGHT; time - 1 minute; minimum altitude - 2100'.
(21) HARBOR VIEW INTSXN - direction of holding - NE of intersection; direction of turn RIGHT; time - 1 minute; minimum altitude - 2100'.
(22) HAMPTON INTSXN - Change holding pattern to standard 2 minute pattern north of intersection.
(23) BEDFORD, MASS., ILS-LOM - Correct to show holding west of LOM, south side of ILS course, right turns, 1 minute pattern, minimum holding altitude 1600'.

LEGEND

(3-31) • Month and day item was reported.
** • New or revised airport, restricted area or miscellaneous data. Pilots should inscribe this information on charts and records.
✱ • New or revised radio data. Pilots should inscribe this information on charts and records.
NOTE: • Such items usually are cited only once, because of space limitations. They are carried permanently, however, when they relate to the erection of obstructions which rise 500' or more above ground. Examples of items carried only once are the erection or removal of: radio or television towers, water tanks, oil derricks, and permanent airport obstructions.

ALABAMA: ANNISTON-RADIO: VOR courses 360°-070° not usable acct course bends and roughness.

LONG BEACH ARPT: Several 230' MSL portable oil derricks W of fld. (10-19) Caution - hvy simulated inst apch tfc on ILS and LF rng during VFR conditions. (11-29)

CALIFORNIA: LONG BEACH-EAST LONG BEACH ARPT: Caution-const W side NE/SW Rnwy and S side E/W Rnwy. Land W and N sides respectively. (7-23)

LOS ANGELES-RADIO: VAR visual courses not usable - moderate scalloping N sector.(5-11)

LOS ANGELES INTERNATIONAL ARPT-TOWER: Jan 31, ASR shut down for approx 4 mos. modernization. (2-1) FLD: Due to non-visibility twr unable to ctl tfc on first 300' and last 600' of Rnwy 34 and last 1000' of Rnwy 29. Equip. on and adj to const areas. Pilots are urged to use extreme caution when operg off-shore just west of arpt. All jet acft departing rnwys 25L/25R climbing in VFR conditions use a 200° departure corridor which originates at approx the intersection of the extended centerlines of the above rnnways with the shoreline. Acft proceeding E-bound from Malibu Intersection in VFR conditions making a track which approx the extended centerlines of the above rnwys are CAUTIONED not to descend below 4000' until passing the shoreline or Del Rey FM unless cleared otherwise by ATC.

NEEDLES-RADIO: VOR 35 n mi coverage from 5°-15° and 190°-205° at 8000' and 50° radial at 10,000'.

OAKLAND: Pilots proposing transbay flgt should ascertain that VFR wea exists within both the San Francisco and Oakland Control Zones, or should obtain ATC clearance for flgt within a ctl zone when wea is less than VFR, since ceiling and visibility mid bay is frequently less than at the two terminals. Tfc operg in VFR wea should avoid vcnty of Alameda NAS. Extensive tfc including jets operate in tfc pat up to 2000' within a radius of 1.7 n mi of the fld. Exercise extreme caution in these areas.

OAKLAND-RADIO: VOR maximum usable dist 35 n mi N thru E at min instr alt.(1-14) DME coverage 80°-120°, 43 n mi at 6000'; 120°-175°,43 n mi at 5000'; 175°-280°, 43 n mi at 4000'; 280°-290°, 35 n mi at 4000'; 290°-305°, 43 n mi at 4000'; 305°-340°, 43 n mi at 6000'; 340°-350°, 35 n mi at 6000'; 350°-030°, 17 n mi at 4000'; 30°-60°, 26 n mi at 5000'; 60°-90°, 35 n mi at 5000'. VOR RECEIVER CHECK SIGNALS

Provisions are being made to provide pilots with a means of checking the accuracy of VOR receivers to insure satisfactory operations of the airborne system. These provisions consist of three different methods: (a) a radiated test signal consisting of a signal radial; (b) certified check points on the airport surface; or (c) certified airborne check points. The radiated test signal is used by tuning the receiver to the published frequency of the test facility. With the flight path deviation indicator (FPDI) centered the omnibearing selector should read 0° with the to-from indication being "From" or the omnibearing selector should read 180° with the to-from indication read "To". Should the VOR receiver be of the automatic indicating type the indication should be 180°. (This is true for all airborne receivers except Mitchell which will indicate 0°). Two means of identification are used with the VOR radiated test signal. In some cases, a continuous series of dots is used while in others a continuous 1020 cycle tone will identify the test signal. Information as to identification of an individual test signal can be obtained from the local control tower. Ground and airborne check points consist of certified radials that should be received at specific points on the airport surface or over specific landmarks while airborne in the immediate vicinity of the airport. Pilots are requested to contact control tower, communication station or airport manager for location details. Should an error in excess of ± 4° be indicated through use of the ground check or ± 6° using the airborne check, IFR flight should not be attempted without first correcting the source of error. CAUTION, no correction other than the "correction card" figures supplied by the manufacturer should be applied in making these VOR receiver checks. As of Mar. 8, 1955 check points or facilitites have been established at the following airports (listed under city name).
